TABLE OF CONTENTS

LIST OF TABLES.....	i
LIST OF FIGURES.....	v
LIST OF ACRONYMS	xiii
ABSTRACT.....	1
1. INTRODUCTION.....	1
2. OBJECTIVES OF THE QA PROJECT	3
3. INTERCOMPARISON EXERCISES.....	3
4. TRACE METAL INTERCOMPARISON EXERCISE RESULTS	5
4.1. 1991 Exercise.....	5
4.1.1. Description of materials and exercise	5
4.1.2. "Accepted" values.....	6
4.1.3. Results.....	6
4.1.3.1. Al, Si, Fe, and Mn.....	6
4.1.3.2. Cr, Cu, and Zn	7
4.1.3.3. As, Cd, Ag, Hg, and Pb	11
4.1.3.4. Se, Sn, and Sb.....	14
4.1.4. Performance evaluation of NS&T laboratories.....	16
4.1.5. Performance evaluation of "core" and "new" laboratories	16
4.2. 1992 Exercise.....	22
4.2.1. Description of materials and exercise	22
4.2.2. "Accepted" values.....	22
4.2.3. Results.....	23
4.2.3.1. Al, Si, Fe, and Mn.....	23
4.2.3.2. Cr, Ni, Cu, and Zn.....	23
4.2.3.3. As, Cd, Ag, Hg, and Pb	27
4.2.3.4. Se, Sn, and Sb.....	30
4.2.4. Performance evaluation of NS&T laboratories.....	32
4.2.5. Performance evaluation of "core" and "new" laboratories	32
4.3. 1993 Exercise.....	32
4.3.1. Description of materials and exercise	36
4.3.2. "Accepted" values.....	36
4.3.3. Results.....	36
4.3.3.1. Al, Si, Fe, and Mn.....	36
4.3.3.2. Cr, Ni, Cu, and Zn.....	38
4.3.3.3. As, Cd, Ag, Hg, and Pb	41
4.3.3.4. Se, Sn, and Sb.....	44
4.3.3.5. Be.....	44
4.3.4. Performance evaluation of NS&T laboratories.....	44
4.3.5. Performance evaluation of "core" and "new" laboratories	46
5. TRACE ORGANIC INTERCOMPARISON EXERCISE RESULTS	46
5.1. 1991 Exercise.....	46
5.1.1. Description of materials and exercise	46
5.1.2. Consensus values.....	46
5.1.3. Results.....	50
5.1.3.1. Tissue Control Material III (QC90TC).....	50
5.1.3.2. Bivalve Tissue Extract II (QA91BE2).....	55
5.1.4. Performance evaluation of NS&T laboratories.....	66
5.2. 1992 Exercise.....	73
5.2.1. Description of materials and exercise	73
5.2.2. Consensus values.....	74

National Oceanic and Atmospheric Administration

ABSTRACT

The NOAA National Status and Trends (NS&T) Program determines the current status and any changes over time of the environmental health of the estuarine and coastal waters of the United States. Concentrations of organic and inorganic contaminants are determined in mollusks, bottom-dwelling fish and sediments collected along the coast of the United States. The quality of the analytical data generated by the NS&T Program is overseen by its QA Project component, which is designed to document sampling protocols, analytical procedures, and laboratory performance, and to reduce intralaboratory and interlaboratory variation. NS&T does not specify analytical methodology. Laboratories can use any analytical procedure as long as the results of the intercomparison exercises are within certain specified limits. All NS&T laboratories are required to participate in yearly intercomparison exercises. The results of the trace organic and trace metals 1991 through 1993 intercomparison exercises are described and discussed.

1. INTRODUCTION

The National Oceanic and Atmospheric Administration's (NOAA) National Status and Trends (NS&T) Program determines the current status of, and any changes over time in the environmental health of the estuarine and coastal waters of the United States, including Alaska and Hawaii. The NS&T Program consists of seven major components, two of which generate monitoring data: the National Benthic Surveillance Project, and the Mussel Watch Project.

Concentrations of organic and inorganic contaminants in sediments and bottom-dwelling fish taken in the same area are determined as part of the National Benthic Surveillance Project at sites located around the nation. The analytes include 24 polycyclic aromatic hydrocarbons, 18 polychlorinated biphenyl congeners, DDT and its metabolites, 9 other chlorinated pesticides, organotins, 4 major elements and 12 trace elements (Table 1). Toxaphene, DNA adducts, and aryl hydrocarbon hydroxylase are measured at certain sites. The frequency of external disease conditions and internal lesions (liver tumors) in the bottomfish are also being documented. Currently, there are about 80 National Benthic Surveillance sites in estuaries and coastal waters, including both urban and rural areas. Samples are generally collected biennially at these sites. Sample collection and analyses for the National Benthic Surveillance Project are currently done by the NOAA National Marine Fisheries Service (NMFS) Northwest Fisheries Science Center (NWFSC), Seattle, WA, and the NMFS/Southeast Fisheries Science Center (SEFSC), Beaufort, NC.

Table 1. Chemicals determined as part of the NOAA National Status and Trends Program.

Polycyclic aromatic hydrocarbons	Chlorinated pesticides other than DDT			
Biphenyl	Aldrin	Dieldrin		
Naphthalene	cis-Chlordane	trans-Nonachlor		
1-Methylnaphthalene	Heptachlor	gamma-HCH		
2-Methylnaphthalene	Heptachlor epoxide	Mirex		
2,6-Dimethylnaphthalene	Hexachlorobenzene			
Acenaphthene				
Acenaphthylene				
1,6,7-Trimethylnaphthalene				
Fluorene				
Phenanthrene	PCB 8	PCB 18	PCB 28	
1-Methylphenanthrene	PCB 44	PCB 52	PCB 66	
Anthracene	PCB 101	PCB 105	PCB 118	
Fluoranthene	PCB 128	PCB 138	PCB 153	
Pyrene	PCB 170	PCB 180	PCB 187	
Benz[a]anthracene	PCB 195	PCB 206	PCB 209	
Chrysene				
Benzo[a]pyrene				
Benzo[e]pyrene				
Perylene	Al	Si	Mn	Fe
Dibenz[a,h]anthracene	Cr	Ni	Cu	Zn

2,4'-DDT				Monobutyltin (degradation product)

The same contaminants are determined in sediments and mussels or oysters as part of the Mussel Watch Project. The bivalves are collected on a yearly basis from approximately 240 sites in the United States, while sediments are collected at the same sites on a less-than-yearly basis. Sample collection and analysis for the Mussel Watch Projects are currently done by the Texas A&M University (TAMU) Geochemical and Environmental Research Group (GERG), College Station, TX, and the Battelle Ocean Sciences (BATTELLE) laboratories at Duxbury, MA, and Sequim, WA.

2. OBJECTIVES OF THE QA PROJECT

The quality of the analytical data generated by the NS&T Program is overseen by the QA Project component, which has been in operation since 1985 and is designed to document sampling protocols and analytical procedures, and to reduce intralaboratory and interlaboratory variation. Details of the NS&T QA Program can be found in Cantillo and Lauenstein (1993). NS&T does not specify analytical methodology. Laboratories can use any analytical procedure as long as the results of the intercomparison exercises are within certain specified limits of the consensus values. This allows the use of new or improved analytical methodology or instrumentation without compromising the quality of the data sets. The analysis of reference materials, such as the National Research Council (NRC) of Canada Certified Reference Materials (CRMs) and National Institute of Standards and Technology (NIST) Standard Reference Materials (SRMs), and of control materials generated for use by NS&T labs as part of the sample stream, is required. To document laboratory expertise, the QA Project requires all NS&T cooperating laboratories to participate in a continuing series of intercomparison exercises utilizing a variety of materials. The organic analytical intercomparison exercises are coordinated by NIST, and the inorganic exercises by NRC Canada. Sampling and analytical protocols used in the NS&T Program since its inception are documented in Lauenstein and Cantillo (1993).

3. INTERCOMPARISON EXERCISES

All the NS&T laboratories are required to participate in the yearly intercomparison exercises which began in 1986. The results of the exercises previous to 1991 are described in Cantillo and Parris (1993) and Valette-Silver (1992). The exercise materials used in the 1991, 1992 and 1993 exercises are listed in Table 2. The exercise materials are usually sent early in the spring or summer, with complete handling instructions and data reporting format. The type and matrix of the samples change yearly.

The results of the intercomparison exercises are not intended to be a reflection of the absolute capability of a laboratory. Given time and budgetary constraints, the methodology used may not be the one resulting in the lowest detection limits or best precision, rather, it is the one that can be used to generate data of the quality specified by the NS&T Program.

In response to the needs of the NS&T Program, NOAA has partially funded the production of eight NIST SRMs and seven internal standard solutions (Table 3). The SRMs are two natural matrix materials and calibration solutions at two concentration levels of the three chemical classes of analytes. The latter are used to facilitate the preparation of multipoint calibration curves. The internal standard solutions were prepared at the request of the NS&T contract laboratories and are provided free of charge. These SRMs and control materials have been and continue to be used by NS&T contract laboratories.

Table 2. Materials used for the NS&T intercomparison exercises for 1991 through 1993.

Year	Materials		
Trace Metal Exercises.....			
1991	Sediment N	Freeze dried sediment from Baie des Chaleurs	
	Mussel P	Tissue homogenate from the Pacific Northwest	
	BCSS-1	Estuarine Sediment CRM	
	SRM 1566a	Oyster Tissue CRM	
1992	Fish Q	Spray-dried Nova Scotia flounder fillet	
	Sediment R	Freeze dried sediment from Chesapeake Bay	
	DORM-1	Dogfish (<i>Squalus acanthias</i>) Muscle CRM	
	BCSS-1	Estuarine Sediment CRM	
1993	Sediment T	Freeze dried sediment from Mississippi Delta	
	Tissue S	Freeze-dried <i>Mytilus edulis</i> tissue from French coast	
	BCSS-1	Estuarine Sediment CRM	
	SRM 1566a	Oyster Tissue CRM	
Trace Organic Exercises.....			
1991	Tissue Control material III	QA90TC	Frozen bivalve tissue homogenate
	Bivalve extract II	QA91BE2	Extract of frozen bivalve tissue homogenate*
1992	Marine sediment III	QA92SED3	Wetted marine sediment prepared using candidate SRM 1941a
	Mussel tissue IV	QA92TIS4	Frozen Mussel Homogenate from Dorchester Bay
1993	Mussel Tissue V	QA93TIS5	Frozen <i>Mytilus edulis</i> homogenate from Boston Harbor (candidate SRM 1974a)
	Fish Homogenate I	QA93FSH1	Carp homogenate from Saginaw Bay (candidate NRC CRM)

* Gravimetrically spiked with one analyte from each of the three chemical classes. The material was not spiked or enriched with the other 48 organic target analytes.

Table 3. NIST SRMs and internal standards funded by the NS&T Program.

SRM 1491	Aromatic Hydrocarbons in Hexane/Toluene
SRM 1492	Chlorinated Pesticides in Hexane
SRM 1493	Chlorinated Biphenyl Congeners in 2,2,4-Trimethylpentane
SRM 1941	Organics in Marine Sediment
SRM 1974	Organics in Mussel Tissue (<i>Mytilus edulis</i>)
SRM 2260	Aromatic Hydrocarbons in Toluene
SRM 2261	Chlorinated Pesticides in Hexane
SRM 2262	Chlorinated Biphenyl Congeners in 2,2,4-Trimethylpentane
AH	Naphthalene-d ₈ , acenaphthene-d ₁₀ , benzo[a]pyrene-d ₁₂ , perylene-d ₁₂
PES	1,2,3-Trichlorobenzene, 4,4'-dibromoctafluorobiphenyl
TCMX	2,4,5,6-Tetrachloro-m-xylene

* SRMs 1491 and 2260; and SRM 1492 and 2261 have the same suite of analytes at different concentrations. SRM 1493 contains twenty PCB congeners, and SRM 2262 contains the same twenty congeners at different concentrations plus eight additional congeners.

4. TRACE METAL INTERCOMPARISON EXERCISE RESULTS

4.1. 1991 Exercise

The fifth NS&T trace metal intercomparison exercise, NOAA/5, took place in 1991 and was coordinated by NRC. The NS&T cooperating laboratories were SEFSC, BATTELLE, and TAMU. Materials were sent to the other 37 laboratories that participated on a voluntary basis. Results were received from the NS&T cooperating laboratories and 26 non-NS&T laboratories. The materials used were Sediment N, BCSS-1, Mussel P and SRM 1566a. The results of the analyses are listed in Appendix I. A detailed description of the exercise and the results of the other participating laboratories can be found in Willie and Berman (1991).

4.1.1. Description of materials and exercise

Sediment N is a siliceous material collected in Nova Scotia Harbor, Canada, and is moderately contaminated. Mussel P is a moderately contaminated tissue homogenate of *Mytilus edulis* specimens collected off the northwest coast of the US by Battelle Pacific Northwest. Sediment for BCSS-1 was collected in the Baie des Chaleurs, Gulf of St. Lawrence. The sediment was freeze-dried, screened to pass through a 125-μm screen, blended, bottled, and radiation-sterilized. BCSS-1 may contain sea salt. The certified values are listed in Table 4, and a more complete description of the preparation, analysis and composition of BCSS-1 can be found in NRC (1990). SRM 1566a was prepared using oysters obtained from a commercial source. The oysters were shucked, frozen, and packaged in sealed plastic bags. The oyster material was ground, freeze-dried, and powdered. At NIST, the material was jet-milled to pass a 355 μm screen, radiation sterilized and bottled. Certified and noncertified values are listed in Table 5, and a more detailed description of the preparation and analysis of SRM 1566a can be found in NIST (1989).

Each laboratory received 10-g samples of each "unknown" sample, and were asked to perform five replicate analysis of each of the two unknowns, BCSS-1 and SRM 1566a, for Al, Cr, Fe, Cu, Zn, As, Se, Cd, Sn, Hg, and Pb. Analyses of Si, Mn, Sb and Tl were optional. The analysis of

Ag was also requested for biological tissues. All results, including outliers, are shown graphically in Figures 1 - 13, and are listed in Appendix I. NRC provided benchmarks for accuracy by analyzing Sediment N and Mussel P by two different methods. Whenever possible, one of these methods was isotope dilution inductively coupled plasma mass spectrometry, which can produce very accurate results.

4.1.2. "Accepted" values

One purpose of the exercise was to arrive at an "accepted" value for each analyte concentration in the unknown materials. The overall mean concentration for each metal was calculated from the mean of laboratory replicates and the NRC data by Willie and Berman (1991). These means were assumed to be normally distributed which may not be a valid assumption at low concentrations. Obvious outliers were eliminated prior to statistical evaluation. A successively applied Student *t* test at the 95% confidence limit was used to identify other outliers. The "accepted" values and uncertainties as well as the certified values and uncertainties for BCSS-1 and SRM 1566a are listed in Tables I.1 - I.4 in Appendix I.

4.1.3. Results

4.1.3.1. Al, Si, Fe, and Mn

The results of the Al, Fe and Mn analyses are shown in Figures 1, 2 and 3 respectively. The results of the five replicate analyses are shown in the figures including any outliers. Only three laboratories and NRC reported Si results. No NS&T laboratory reported Si values for this exercise. The means of the five replicate analysis of Al for Sediment N and BCSS-1 reported by the NS&T cooperating laboratories were within the 95% confidence interval of each material. The precision was better for Sediment N although the Al levels of the two materials were similar. Aluminum analysis of tissues was not required. The Fe results of the Sediment N and

* Uncertainties represent 95% confidence limits.

Mussel P analyses by all three NS&T laboratories were within the confidence intervals of the accepted value. Although the concentrations of Fe in the sediment materials and tissue materials were similar, BCSS-1 and SRM 1566a have much smaller confidence intervals. BATTELLE and SEFSC results were within the confidence interval for BCSS-1, while TAMU reported slightly higher results. All three laboratories reported good results for SRM 1566a. The precision of the Fe analyses was good for all three NS&T cooperating laboratories. The results of the analyses of Mn in the sediment materials were within the confidence intervals and the precision was good. The determination of Mn in tissues was not required.

4.1.3.2. Cr, Cu, and Zn

The results of the Cr, Cu, and Zn analyses are shown in Figures 4, 5 and 6 respectively. No Cr results were reported by SEFSC for sediment or tissue materials. The means of the Cr analyses by BATTELLE and TAMU were within the confidence interval of all four materials. Willie and Berman (1991) found that, in general, intralaboratory precision for Cr was worse than for most analytes. The results of the Cu analyses by the three NS&T cooperating laboratories were good for both the sediment and tissue materials, although the Mussel P mean for SEFSC was slightly high. Similar results were obtained for Zn.

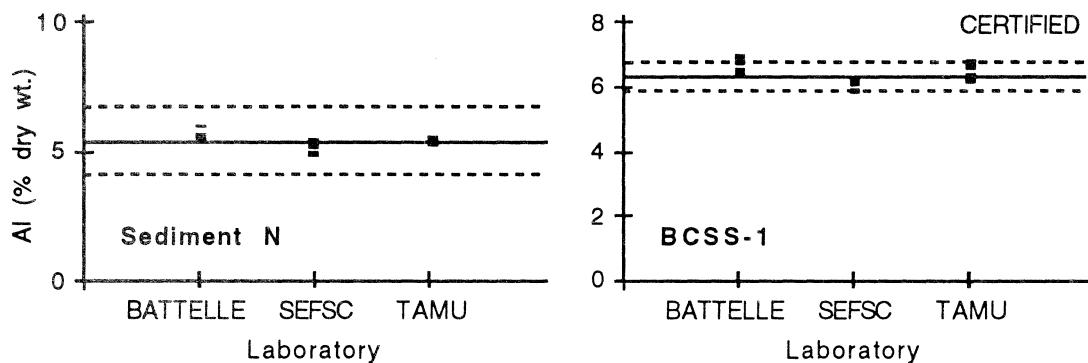

Figure 1. 1991 NOAA/5 Al intercomparison exercise results of five replicates for Sediment N and BCSS-1. (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) (% dry wt.).

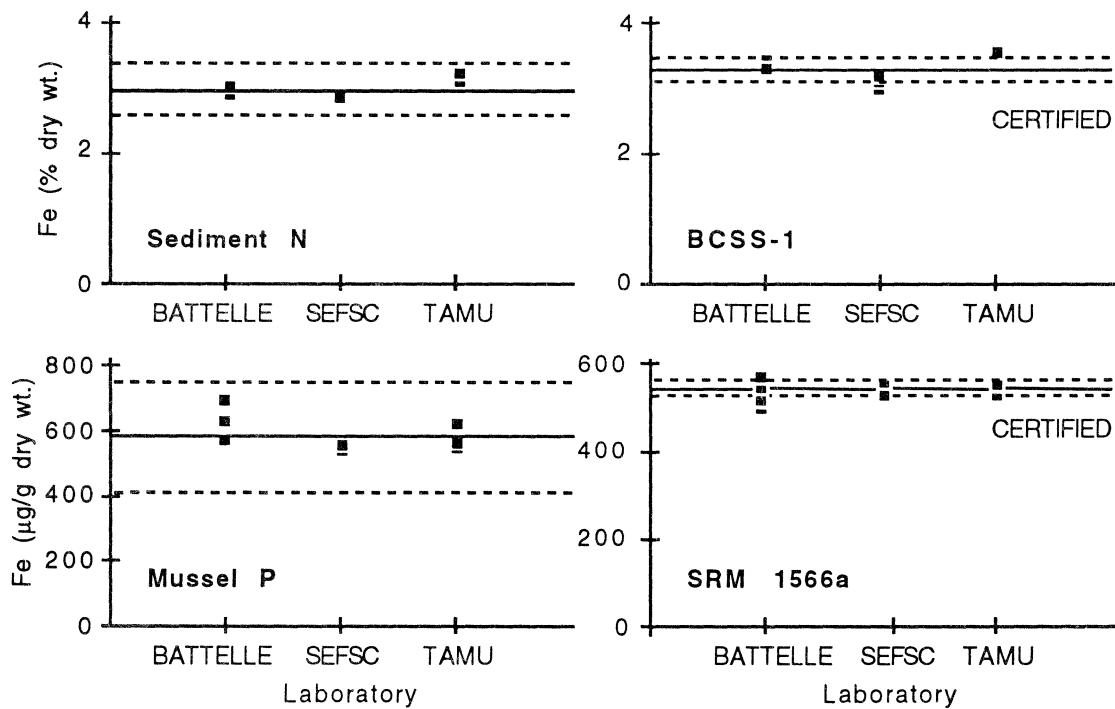

Figure 2. 1991 NOAA/5 Fe intercomparison exercise results of five replicates for Sediment N, BCSS-1, Mussel P, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) (% or $\mu\text{g/g}$ dry wt. as noted).

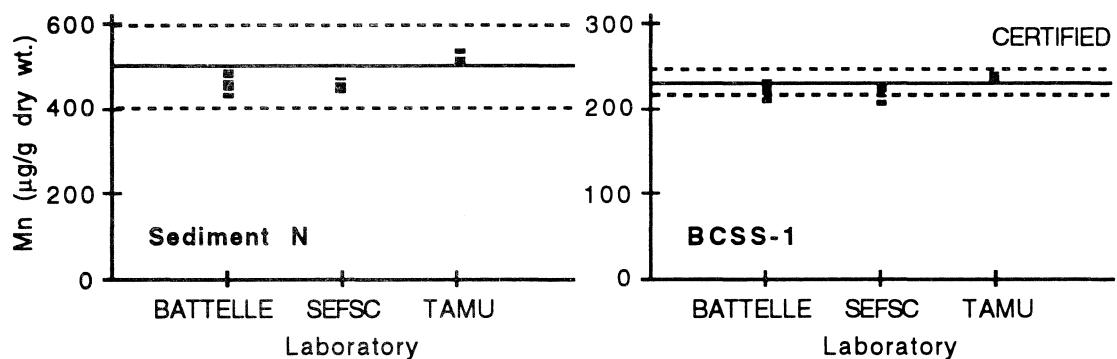

Figure 3. 1991 NOAA/5 Mn intercomparison exercise results of five replicates for Sediment N and BCSS-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

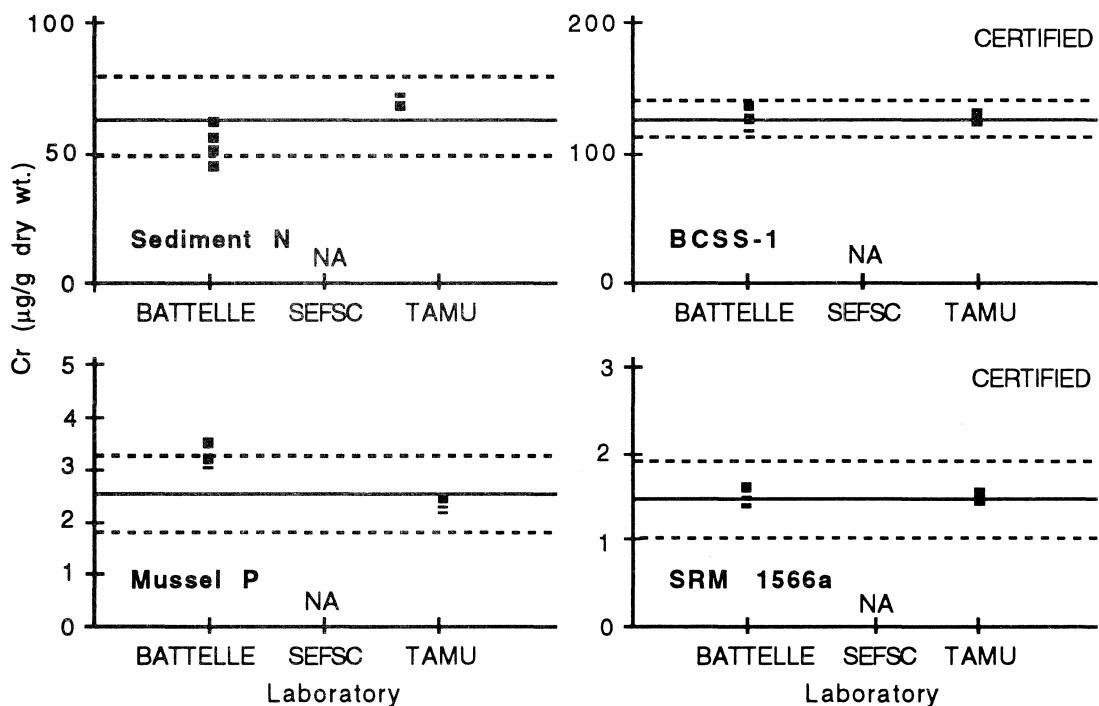

Figure 4. 1991 NOAA/5 Cr intercomparison exercise results of five replicates for Sediment N, BCSS-1, Mussel P, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm uncertainty. NA - not analyzed.) ($\mu\text{g/g}$ dry wt.).

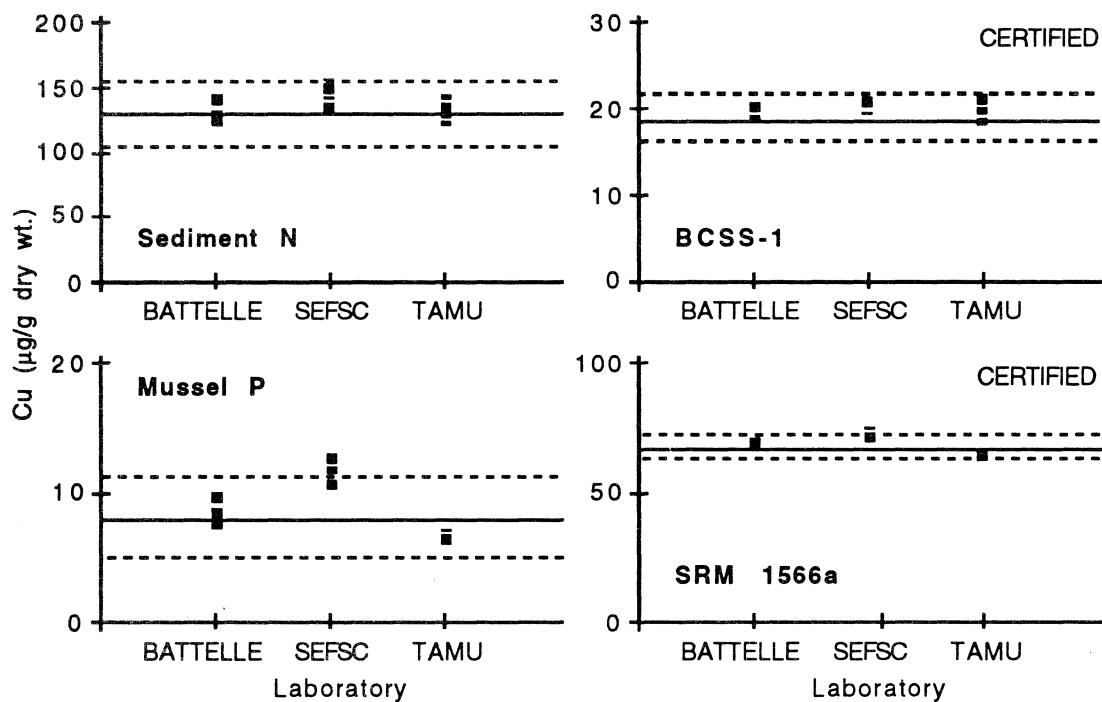

Figure 5. 1991 NOAA/5 Cu intercomparison exercise results of five replicates of Sediment N, BCSS-1, Mussel P, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g dry wt.}$).

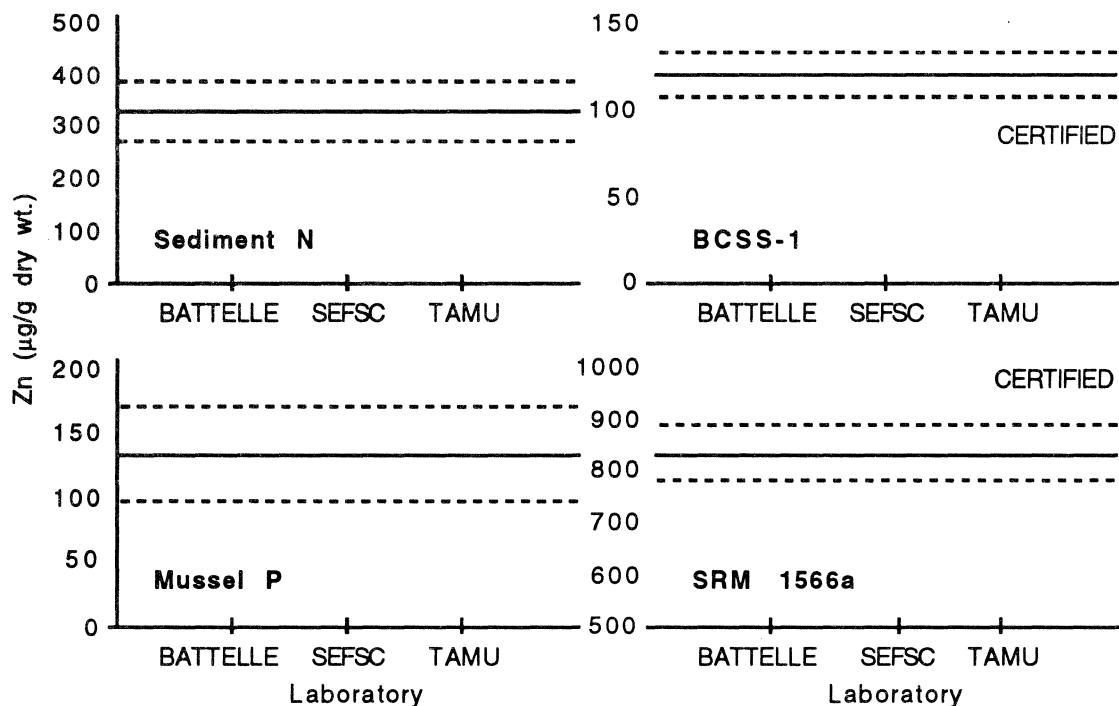

Figure 6. 1991 NOAA/5 Zn intercomparison exercise results of five replicates for Sediment N, BCSS-1, Mussel P, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g dry wt.}$).

4.1.3.3. As, Cd, Ag, Hg, and Pb

The results of the As, Cd, Ag, Hg, and Pb analyses are shown in Figures 7, 8, 9, 10 and 11 respectively. The means of the As results reported by the three NS&T cooperating laboratories were within the confidence intervals of the four exercise materials. SEFSC and TAMU reported Cd means within the confidence interval of the two sediment materials, while the BATTELLE mean for BCSS-1 was high. The certified BCSS-1 Cd concentration, $0.25 \pm 0.04 \mu\text{g/g}$, is one order of magnitude lower than that of the "accepted" value for Cd for Sediment N, $2.03 \pm 0.58 \mu\text{g/g}$. The detection limit reported by BATTELLE for sediments is $0.12 \mu\text{g/g}$, approximately half of the certified value of BCSS-1 (Tables 4 and 6). The Cd results of the analyses of the tissue materials by all three laboratories were good and within the confidence intervals. The determination of Ag in sediments was not required. The results of the Ag analyses of the tissue exercise materials by the three NS&T cooperating laboratories were within the confidence intervals. The results of the Hg analyses of the sediment and tissue materials were also within the confidence intervals.* The results of the Pb analyses of the four exercise materials were within the confidence intervals, except for those of SEFSC for SRM 1566a, which were slightly high, and those of BATTELLE for the same material, which were slightly low.

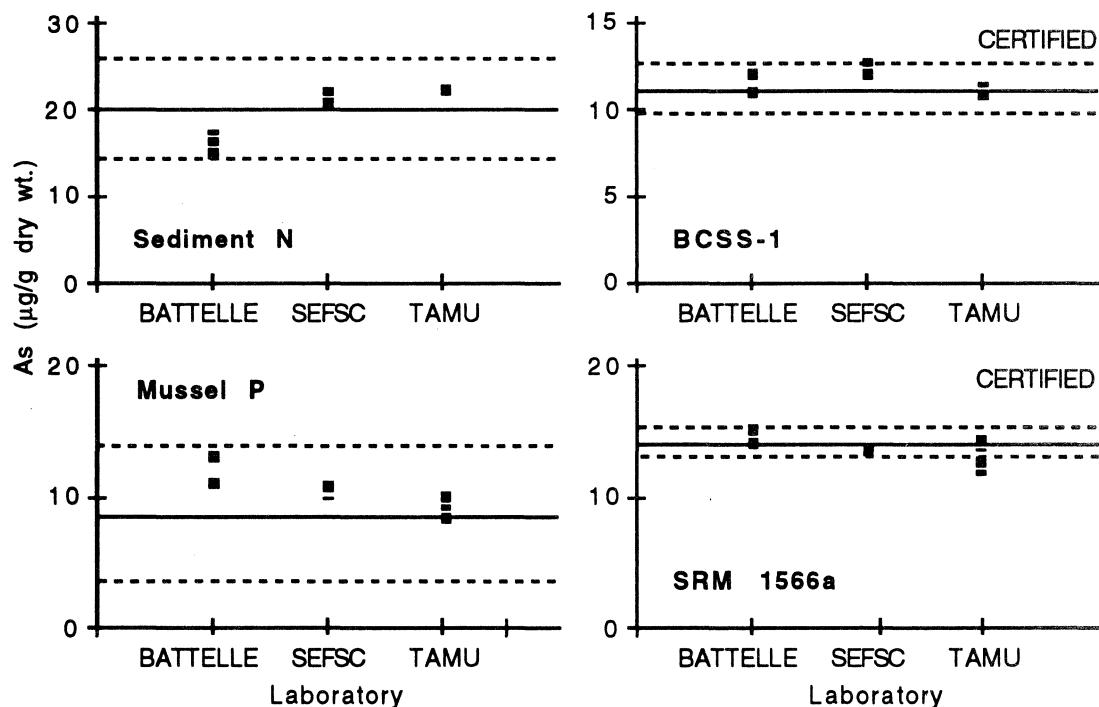

Figure 7. 1991 NOAA/5 As intercomparison exercise results of five replicates for Sediment N, BCSS-1, Mussel P, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

* BCSS-1 is no longer certified for Hg.

4.1.3.4. Se, Sn, and Sb

The results of the Se analyses are shown in Figure 12. The calculated confidence interval for Sediment N was large, $\pm 45\%$. All three NS&T cooperating laboratories reported mean values within the confidence interval for this material. The certified value and confidence interval for Se for BCSS-1 are $0.43 \pm 0.06 \mu\text{g/g}$ dry wt. The certified value was below the MDL for BATTELLE, $< 0.8 \mu\text{g/g}$. Some of the Se values for BCSS-1 reported by SEFSC were slightly above the upper limit of the confidence interval. The values reported by TAMU were within the confidence interval. The Se analyses of the two tissue materials were within the confidence intervals except for some of the replicates reported by BATTELLE for SRM 1566a.

The results of the Sn analyses are shown in Figure 13. The three NS&T cooperating laboratories reported mean values within the confidence interval of Sediment N, Mussel P and SRM 1566a, except for SEFSC, which reported values below the confidence intervals for SRM 1566a and values below the MDL for the Mussel P material. The Sb concentration found in BCSS-1 were much lower than those of Sediment N. Two of the NS&T laboratories reported values above the confidence interval, and the other reported values below. The mean values of each of the three laboratories, however, were not far outside the confidence intervals.

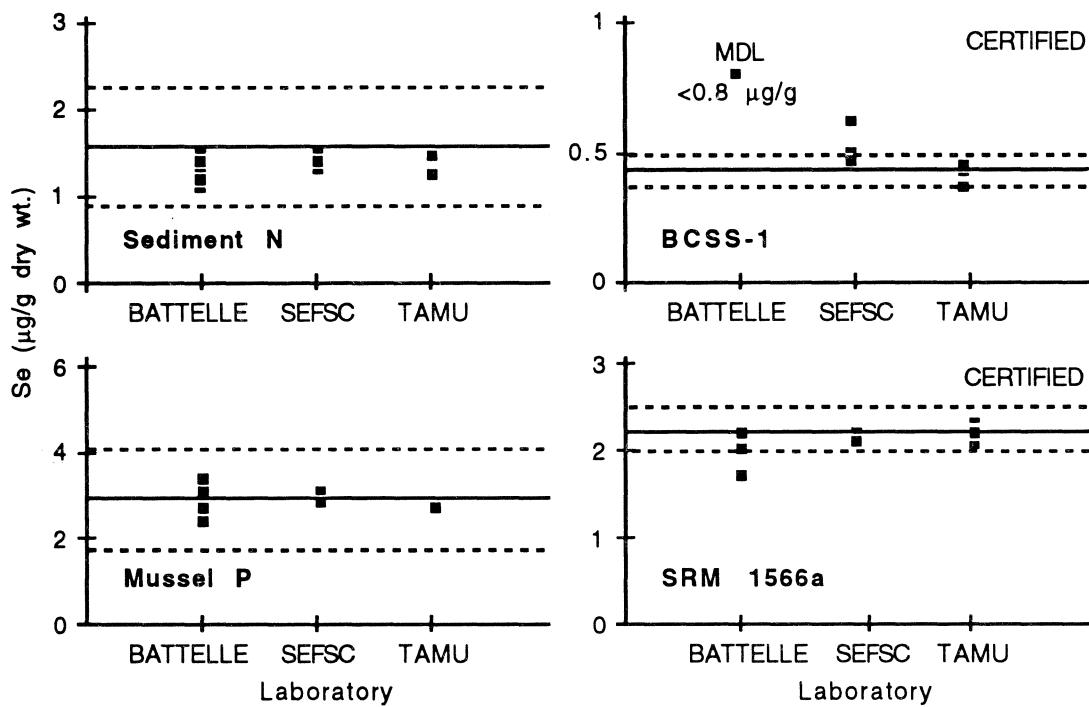

Figure 12. 1991 NOAA/5 Se intercomparison exercise results of five replicates for Sediment N, BCSS-1, Mussel P, and SRM 1566a. (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm uncertainty. MDL is the method detection limit.) ($\mu\text{g/g}$ dry wt.).

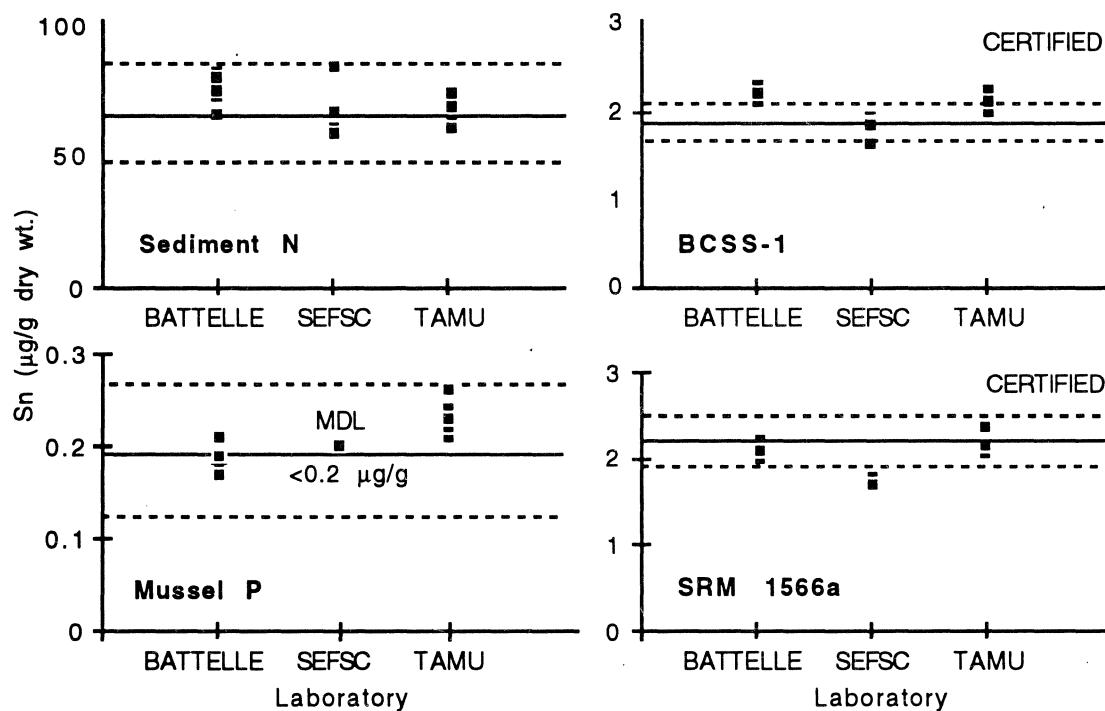

Figure 13. 1991 NOAA/5 Sn intercomparison exercise results of five replicates for Sediment N, BCSS-1, Mussel P, and SRM 1566a. (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

The analysis of Sb was optional, and BATTELLE was the only NS&T laboratory that reported Sb results. Only six laboratories reported results for the analysis of Sb in Sediment N, and no accepted value was calculated. Four laboratories reported results for BCSS-1. The results reported by BATTELLE were within the confidence interval for the CRM.

4.1.4. Performance evaluation of NS&T laboratories

Willie and Berman (1991) summarized the results of the 1991 NOAA/5 exercise using an accuracy and precision scale (Table 7). The same information is shown graphically in Figures 14 and 15. Accuracy was judged to be excellent if all the replicates were within the established confidence interval, or good if the mean of the replicates was within the established confidence interval but one or more of the replicates was outside the interval. Low or high results, being lower or higher than the confidence intervals, were also evaluated. The intralaboratory precision was judged to be good if the percent relative standard deviation (%RSD) of the five replicates met the following criteria for various analyte concentrations: for concentrations greater than 10 µg/g, the expected RSD was ±10%; for concentrations between 1 and 10 µg/g, the expected RSD was ±15%; and for concentrations lower than 1 µg/g, the expected RSD was ±20%. The expected %RSD for Al and Fe in sediments was ±5%. Precision was judged to be poor if the %RSD requirements described above were not met. The accuracy and precision achieved by three NS&T cooperating laboratories was rated good to superior in the NOAA/5 exercise.

4.1.5. Performance evaluation of "core" and "new" laboratories

There is an apparent correlation between level of performance and previous experience in intercomparison exercises. Willie and Berman (1991) compared the results of "core" laboratories that participated in one or more of the four previous NOAA intercomparison exercises with the results of those of laboratories participating for the first time. The means and standard deviations of the two laboratory groups are listed in Tables 8 and 9 for sediment and tissue analyses respectively. Conspicuous outliers were not included in the calculation of the means. The new participants produced lower means and worse precision for both sets of analyses than those produced by the core laboratories. The results of the sediment analysis may be the results of incomplete dissolution of the sample. It is essential to incorporate HF in the dissolution procedure. The reason for lower means for the tissue analysis was not apparent.

Table 7. Laboratory performance evaluation for NOAA/5 (First letter is the evaluation of the accuracy and the other of the precision.).

Accuracy:	E	-	Excellent accuracy. All replicates were within the established confidence interval.									
	G	-	Good accuracy. The mean of the replicates was within the established confidence interval but one or more of the replicates was outside.									
	L	-	Low results. The mean of the replicates was less than the lower confidence interval.									
	H	-	High results. The mean of the replicates was greater than the higher confidence interval.									
	?	-	Accuracy could not be established.									
Precision:	G	-	Good precision. The intralaboratory precision was within the following criteria for various analyte concentrations: concentration $\geq 10 \mu\text{g/g}$, expected RSD $\pm 10\%$ ($\pm 5\%$ for Al and Fe in sediments); concentration $\geq 1 - < 10 \mu\text{g/g}$, expected RSD $\pm 15\%$; and concentration $< 1 \mu\text{g/g}$, expected RSD $\pm 20\%$									
	X	-	The intralaboratory precision was not within the criteria described above.									
	-	-	No results or a "less than" value submitted.

* Laboratories that have participated in one or more of the former four NOAA intercomparison exercises.

4.2. 1992 Exercise

The sixth NS&T trace metals intercomparison exercise, NOAA/6, took place in 1992 and was coordinated by NRC. The NS&T cooperating laboratories were SEFSC, BATTELLE, and TAMU. Materials were sent to 39 other laboratories, some of which participated on a voluntary basis. Results were received from the NS&T cooperating laboratories and 32 non-NS&T laboratories. The materials used were Sediment R, BCSS-1, Fish Q and DORM-1. The results of the analyses are listed in Appendix II. A detailed description of the exercise and the results of the other participating laboratories can be found in Willie and Berman (1992).

4.2.1. Description of materials and exercise

Sediment R is a freeze dried sediment from Chesapeake Bay donated by the NIST. Fish Q is a spray-dried sample of filleted flounder collected off the east coast of Nova Scotia, Canada, and prepared for NRC by the Technical University of Nova Scotia. DORM-1, Dogfish Liver, is composed of dogfish (*Squalus acanthias*) liver containing 5% fat. The livers were cleaned and frozen for storage, thawed, homogenized and extracted with acetone to produce a partially defatted protein powder. This powder was screened through a 24-mesh nylon screen, mixed, bottled, and radiation sterilized. The certified values are listed in Table 10, and a more complete description of the preparation and analysis of DORM-1 can be found in NRC (1986).

As for the NOAA/5 exercise, each laboratory received 10-g samples of each "unknown" sample, and were asked to perform five replicate analyses of each of the two unknowns, BCSS-1, and DORM-1, for Al, Cr, Fe, Ni, Cu, Zn, As, Se, Ag, Cd, Sn, Hg and Pb. Analyses of Si, Mn, Sb and Ti were also required for Sediment R and BCSS-1. The results are shown graphically in Figures 16 - 30, and are listed in Appendix II. NRC provided benchmarks for accuracy by analyzing Sediment R and Fish Q by two different methods, including IDICPMS when possible.

4.2.2. "Accepted" values

"Accepted" values were calculated from the mean of laboratory replicates and the NRC data as described in Section 4.1.2. The "accepted" values and uncertainties as well as the certified values and uncertainties for BCSS-1 and DORM-1 are listed in Tables II.1 - II.4 in Appendix II.

Table 10. Major and trace element certified concentrations and uncertainties available for DORM-1, Dogfish Muscle (Uncertainties represent 95% tolerance limits.) ($\mu\text{g/g}$ dry weight unless noted).

Element	Value	Uncertainty (\pm)	Element	Value	Uncertainty (\pm)
Na (%)	0.800	0.060	Cu	5.22	0.33

Co	0.049	0.014	Methyl Hg	0.731	0.060
Ni	1.20	0.30			

4.2.3. Results

4.2.3.1. Al, Si, Fe, and Mn

The results of the Al, Fe and Mn analyses are shown in Figures 16, 17 and 18, respectively. The means of the three NS&T cooperating laboratories for Al were within the 95% confidence interval of Sediment R and BCSS-1, although the mean reported by BATTELLE for BCSS-1 was slightly high (Figure 16). Aluminum analysis of tissues was not required. The analysis of Si in tissues was not required and only one of the three laboratories reported Si values in sediments. The Si results for BCSS-1 were within the certified range for the CRM. Although there were insufficient data to determine an accepted value for Sediment R, the results of the three reporting laboratories were comparable. The Fe results are shown in Figure 17. BATTELLE and TAMU reported means within the confidence interval of Sediment R and BCSS-1. SEFSC reported a mean value of $2.22 \pm 0.03\%$ for Sediment R, higher than the accepted value of $1.88 \pm 0.25\%$, and outside the confidence interval. The confidence interval for Fish Q was large, approximately $\pm 47\%$, and the three NS&T laboratories reported values within the confidence interval. The confidence interval of DORM-1 was $\pm 8\%$. BATTELLE and TAMU reported mean values within the confidence interval. The mean value reported by SEFSC was $70 \pm 3 \mu\text{g/g}$, slightly above the certified value and confidence interval of DORM-1, $63.6 \pm 5.3 \mu\text{g/g}$. The Mn results are shown in Figure 18. The determination of Mn in tissues was not required. The mean values reported by BATTELLE and SEFSC were within the confidence intervals for Sediment R and BCSS-1. No Mn results were reported by TAMU.

4.2.3.2. Cr, Ni, Cu, and Zn

The results of the Cr, Ni, Cu, and Zn analyses are shown in Figures 19, 20, 21, and 22, respectively. The mean Cr values reported by the three NS&T cooperating laboratories were within the confidence intervals of each of the exercise materials, except for the SEFSC result for BCCS-1 which was low, $92 \mu\text{g/g}$, compared to the certified value of $123 \mu\text{g/g}$, and the BATTELLE result for DORM-1 which was high, $4.2 \mu\text{g/g}$, compared with the certified value of $3.6 \mu\text{g/g}$. Low Cr values for sediment samples may be indicative of incomplete dissolution. The BATTELLE mean value for DORM-1, $4.2 \mu\text{g/g}$, was slightly higher than the upper limit of the confidence interval, $4.0 \mu\text{g/g}$. Nickel was not a target analyte for previous exercises. The results of the Ni analyses of the four exercise materials by BATTELLE and TAMU

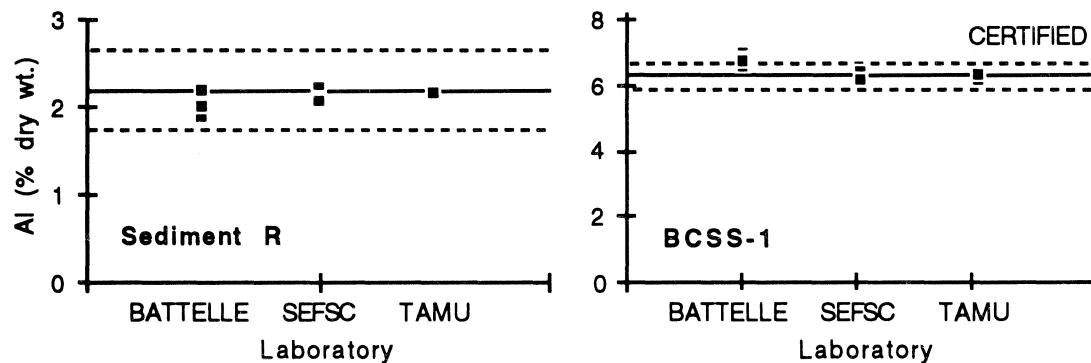

Figure 16. 1992 NOAA/6 Al intercomparison exercise results of five replicates for Sediment R and BCSS-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm uncertainty.) (% dry wt.).

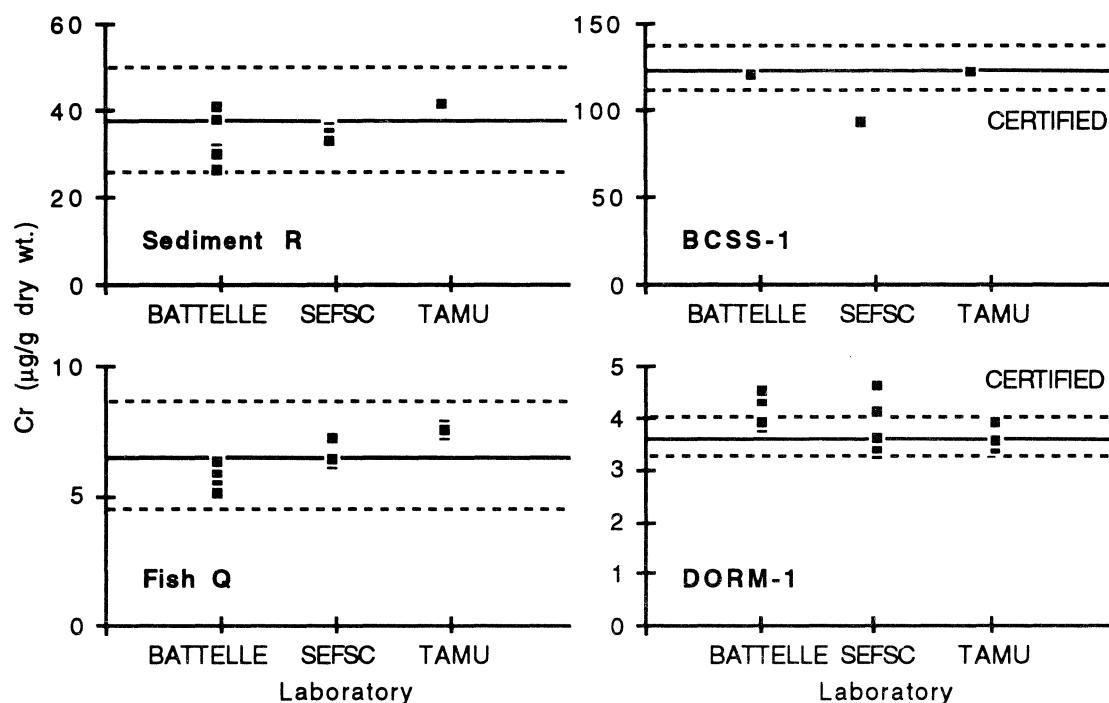

Figure 19. 1992 NOAA/6 Cr intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

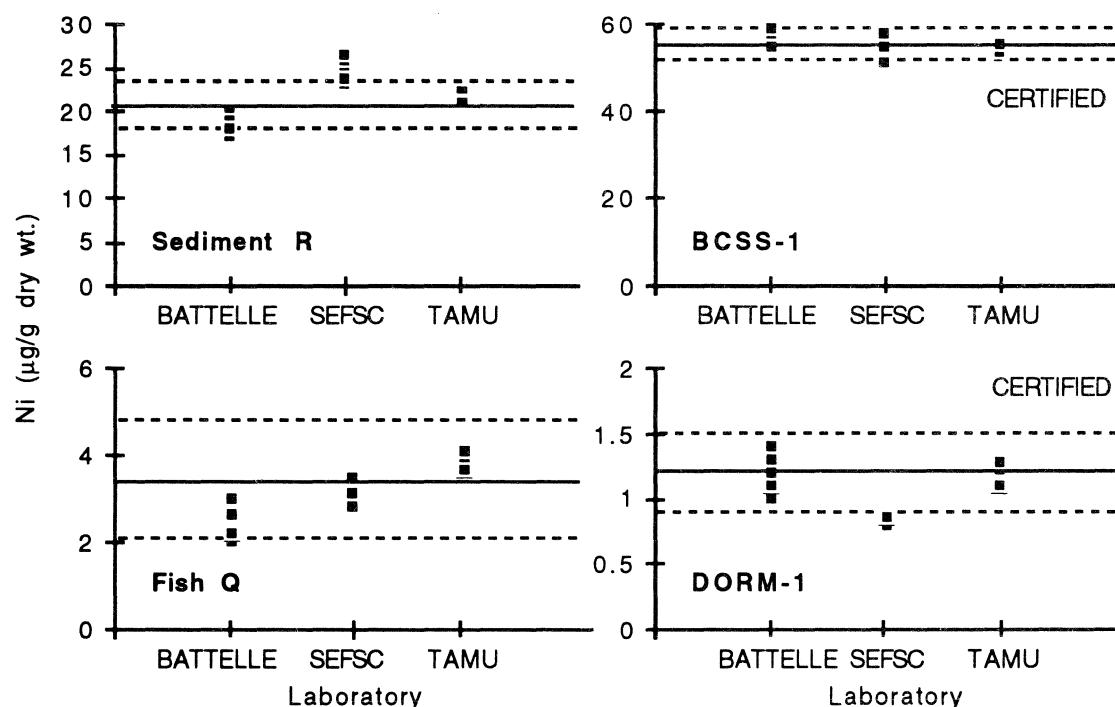

Figure 20. 1992 NOAA/6 Ni intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.). ($\mu\text{g/g}$ dry wt.).

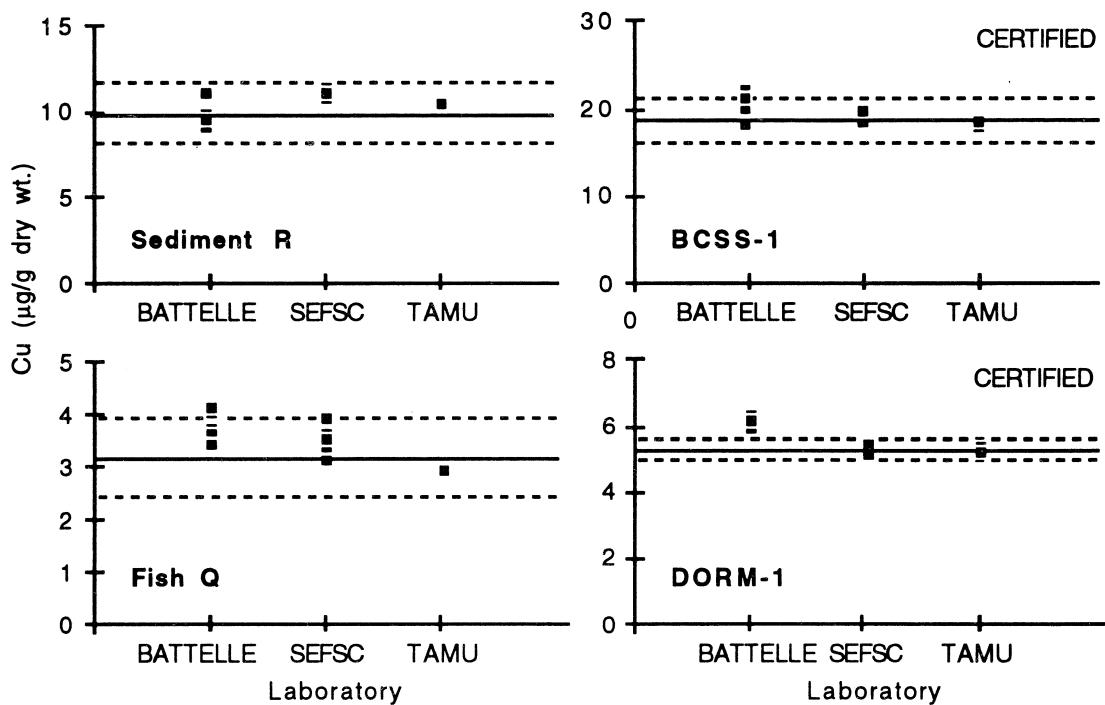

Figure 21. 1992 NOAA/6 Cu intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g dry wt.}$).

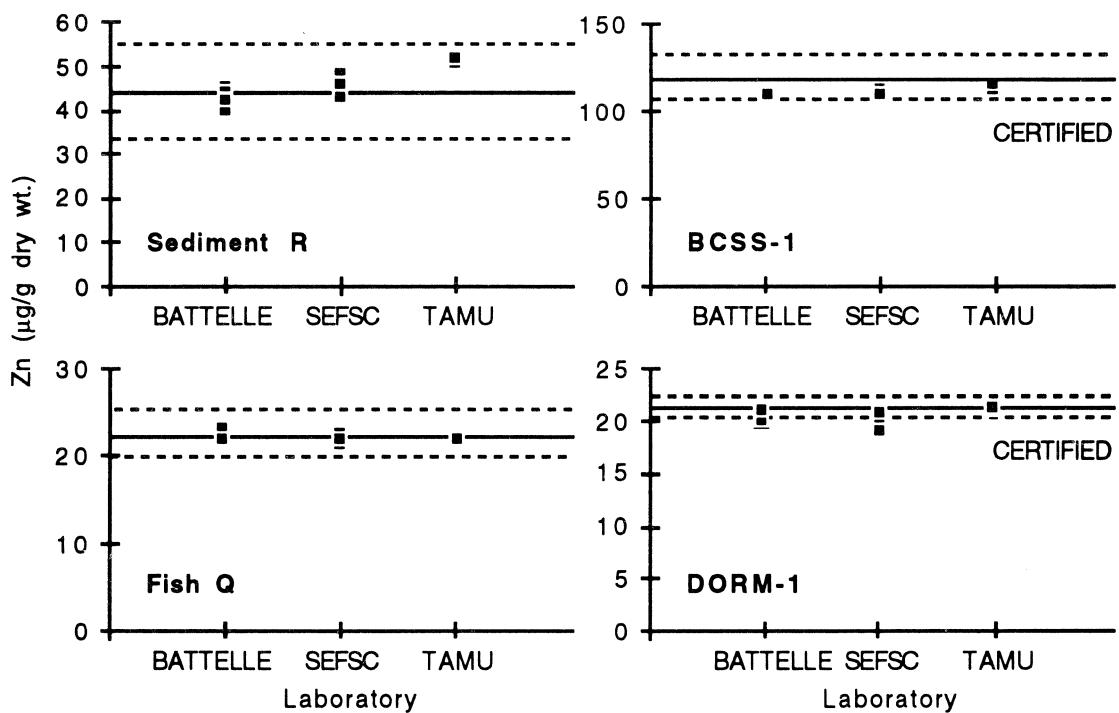

Figure 22 1992 NOAA/6 Zn intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g dry wt.}$).

were within the confidence intervals. The mean Ni value reported by SEFSC for DORM-1, 0.084 µg/g, was slightly lower than the lower limit of the confidence interval, 0.9 µg/g. The mean Ni reported by SEFSC for Sediment R, 24.7 µg/g, was slightly above the higher limit of the confidence interval, 23.5 µg/g. The SEFSC results for the other materials were within the confidence intervals. The mean Cu values reported by the three NS&T cooperating laboratories were within the confidence intervals of each of the exercise materials except for the BATTELLE results for DORM-1, 6.2 µg/g, compared to the upper limit of the confidence interval, 5.55 µg/g (Figure 21). The mean Zn values were within the confidence intervals except for the SEFSC mean for DORM-1, 19.7 µg/g, which was just below the lower limit of the confidence interval, 20.3 µg/g (Figure 22). The confidence interval for DORM-1 was only \pm 10%, which is very narrow.

4.2.3.3. As, Cd, Ag, Hg, and Pb

The results of the As, Cd, Ag, Hg, and Pb analyses are shown in Figures 23, 24, 25, 26, and 27, respectively. The means of the As results reported by the three NS&T cooperating laboratories were within the confidence intervals of the four exercise materials (Figure 23). The means of the Cd results for Sediment R and BCSS-1 were within the confidence intervals of the exercise materials (Figure 24). Similar results were reported for Fish Q and DORM-1 by SEFSC and TAMU. The Cd results reported by BATTELLE for Fish Q and DORM-1 have %RSDs of 43% and 42% respectively, and the mean values are outside the confidence intervals. The reported MDL for BATTELLE for tissues is 0.21 µg/g (Table 6), which is higher than the accepted value for Fish Q and the certified value for DORM-1. The results of the Ag analyses are shown in Figure 25. The Ag concentration of Sediment R was quite low, 0.40 ± 0.022 µg/g.

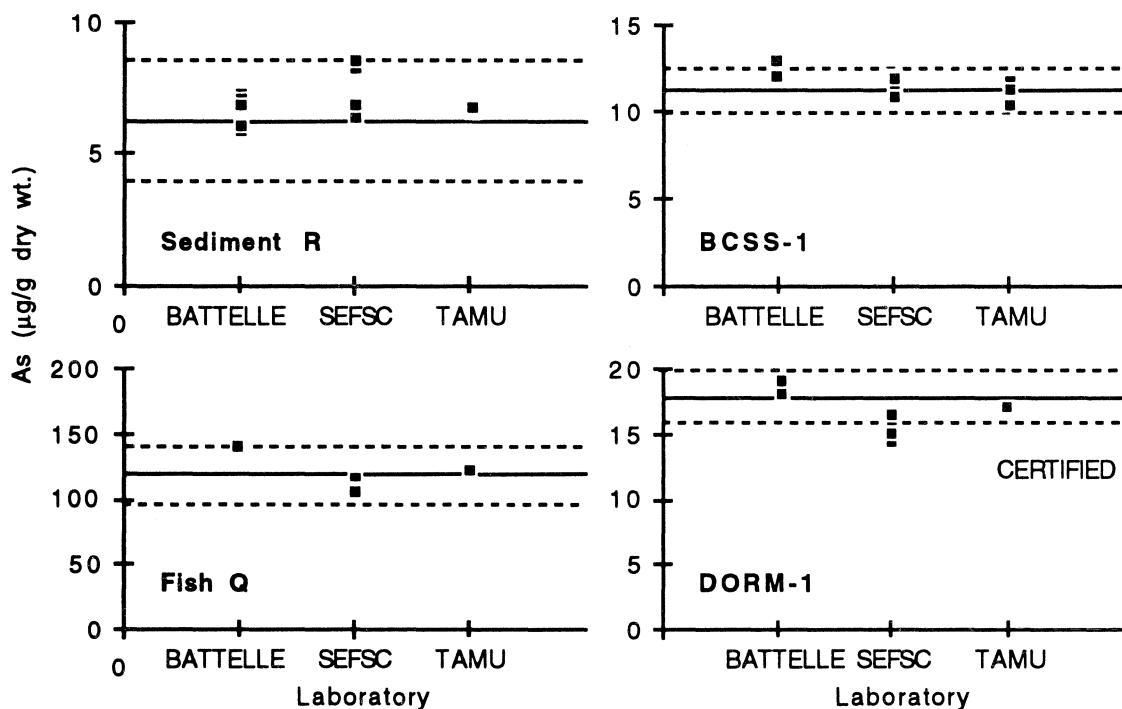

Figure 23. 1992 NOAA/6 As intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 (µg/g dry wt.) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm 95% confidence limit.).

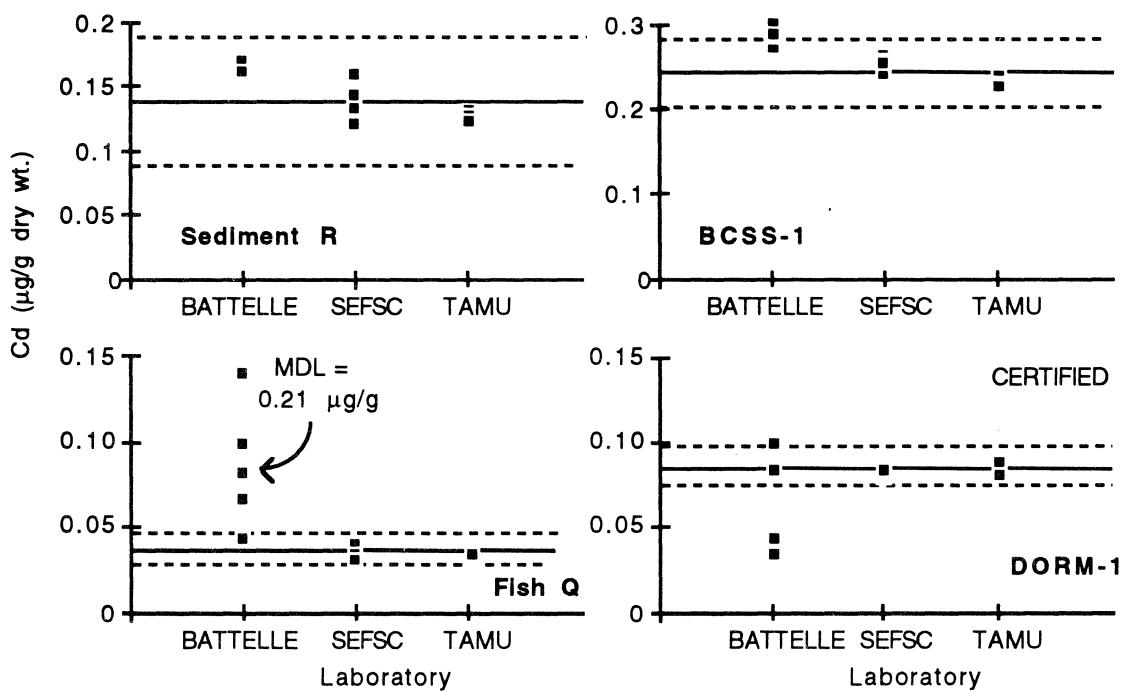

Figure 24. 1992 NOAA/6 Cd intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g}$ dry wt.) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.).

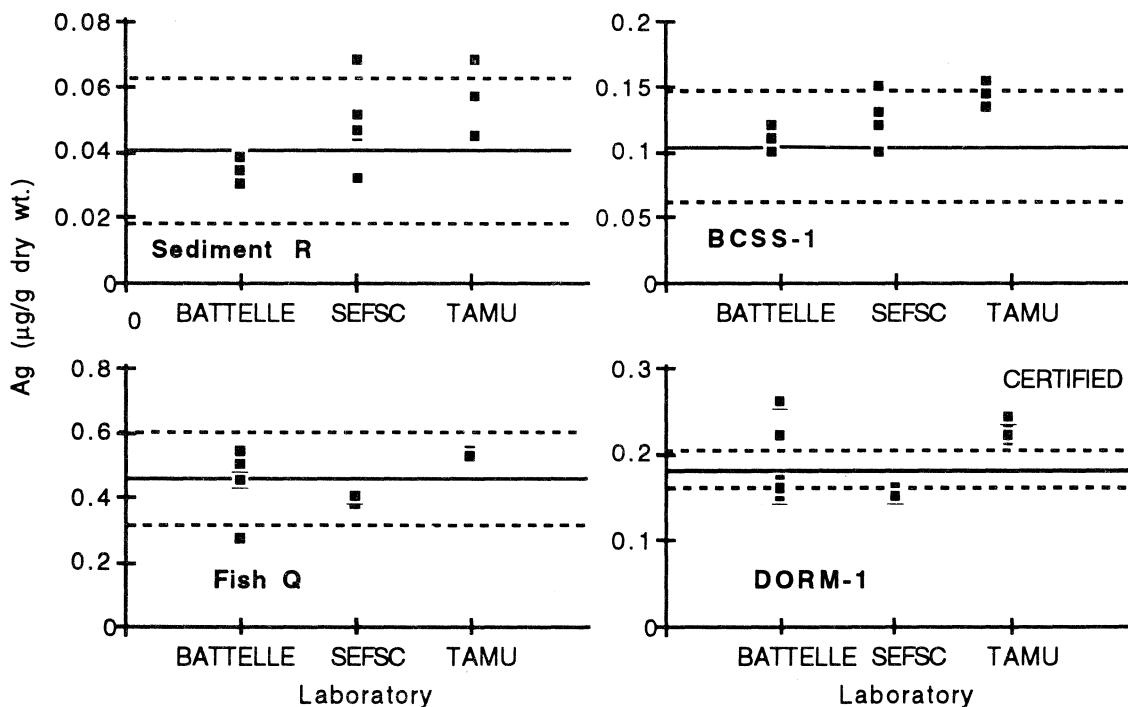

Figure 25. 1992 NOAA/6 Ag intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g}$ dry wt.) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.).

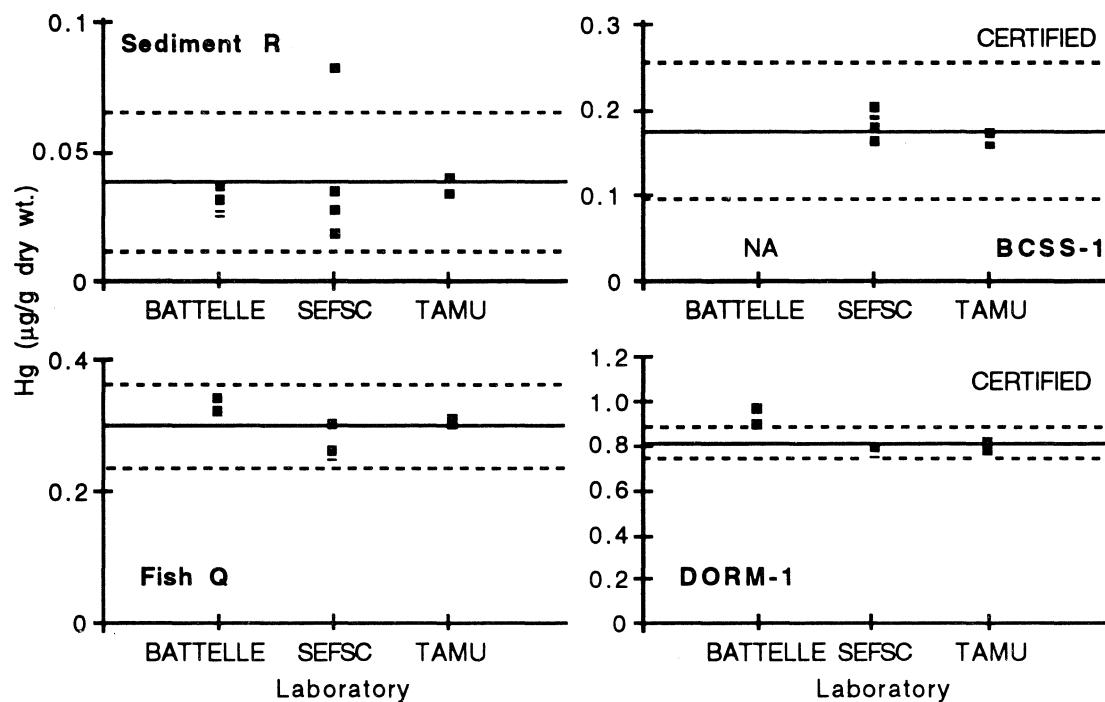

Figure 26. 1992 NOAA/6 Hg intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g dry wt.}$) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm uncertainty. NA - Not available.).

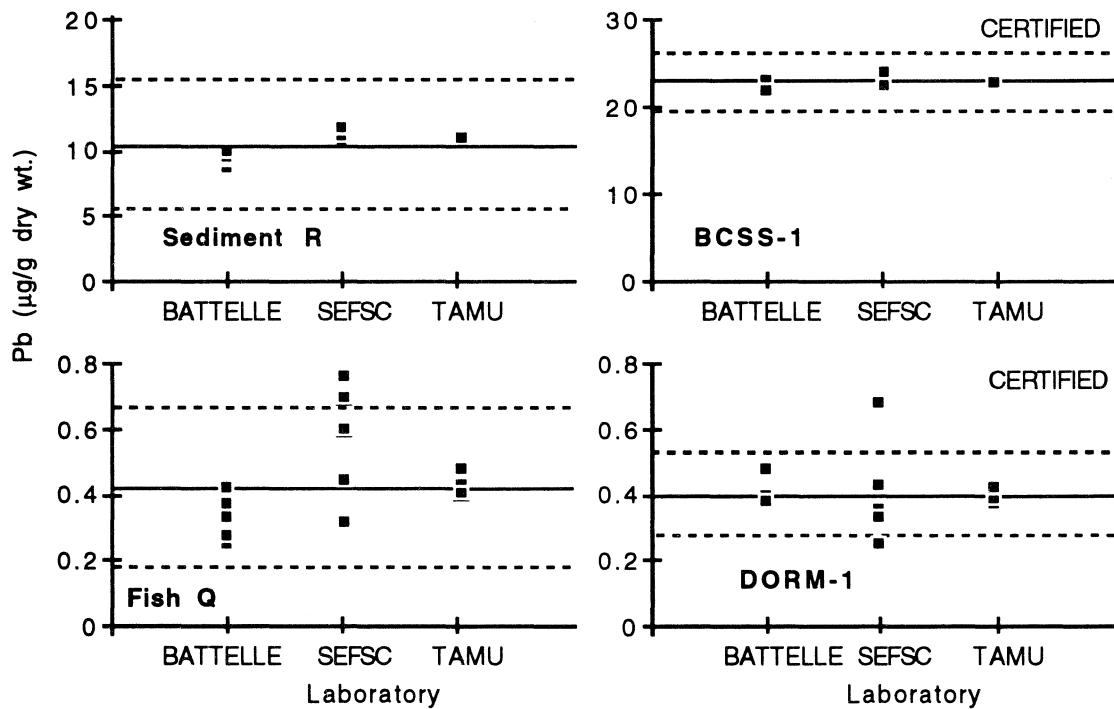

Figure 27. 1992 NOAA/6 Pb intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g dry wt.}$) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.).

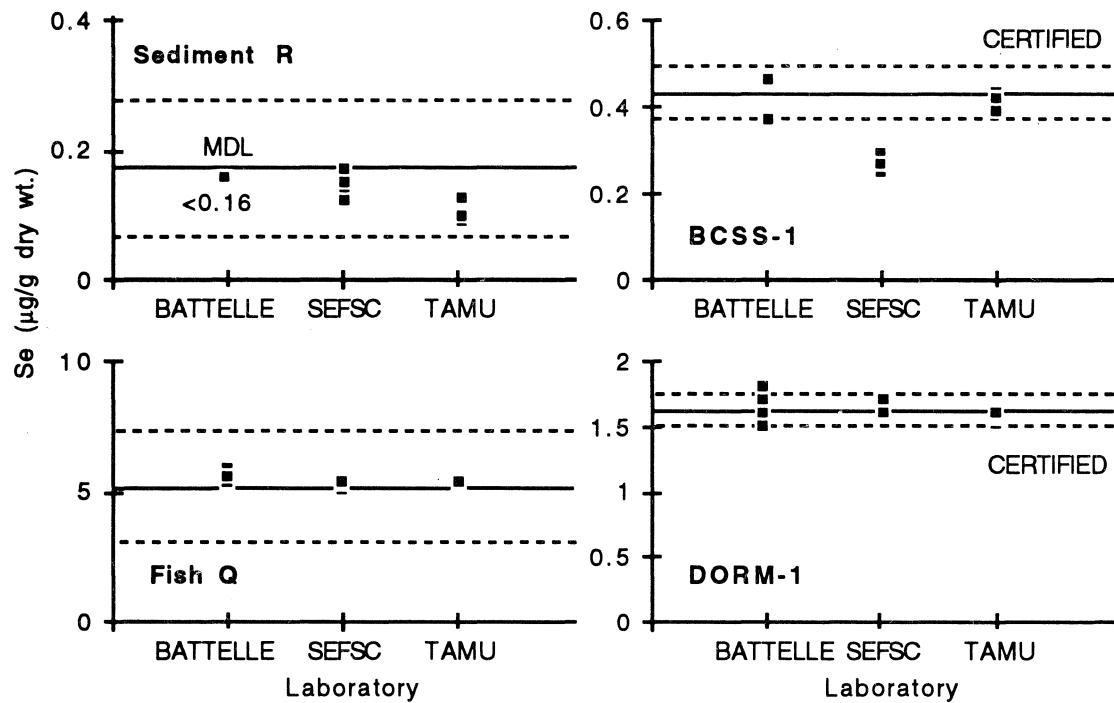

Figure 28. 1992 NOAA/6 Se intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g}$ dry wt.) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.).

There is no certified value for BCSS-1. The results of the three NS&T laboratories, however, were within the confidence interval of both materials. The mean values reported for the Fish Q were also within the confidence intervals. The accepted Ag value for Fish Q is $0.18 \pm 0.022 \mu\text{g/g}$. BATTELLE reported a slightly high mean value of $0.19 \mu\text{g/g}$ for DORM-1, and TAMU a slightly high one of $0.23 \pm 0.02 \mu\text{g/g}$. The Hg content of Sediment R was quite low, only $0.038 \pm 0.027 \mu\text{g/g}$. The results of the three NS&T cooperating laboratories were within the confidence interval of this material. Similar results were reported for BCSS-1, although no Hg data were submitted by BATTELLE. The results for the tissue materials were also good. The BATTELLE Hg mean, $0.092 \mu\text{g/g}$, was slightly high compared to the upper limit of the confidence interval, $0.872 \mu\text{g/g}$. The performance of the three NS&T cooperating laboratories was very good for all four exercise materials for Pb. The Pb level in Fish Q, $0.42 \pm 0.24 \mu\text{g/g}$, was very low so the precision of the results was lower than for the other three sets of analyses. Overall, the best results for all the laboratories participating in NOAA/6 were for Pb.

4.2.3.4. Se, Sn, and Sb

The results of the Se, Sn and Sb analyses are shown in Figures 28, 29, and 30, respectively. The Se concentration of Sediment R was quite low, $0.17 \mu\text{g/g}$, and this was close to the MDL for BATTELLE, $0.16 \mu\text{g/g}$. The results reported by SEFSC and TAMU were within the confidence intervals for this material. The mean of the results reported by SEFSC for BCSS-1, $0.28 \mu\text{g/g}$, was below the lower limit of the confidence interval, $0.37 \mu\text{g/g}$. The results reported by BATTELLE and TAMU were within the confidence interval for BCSS-1. The results of the Se

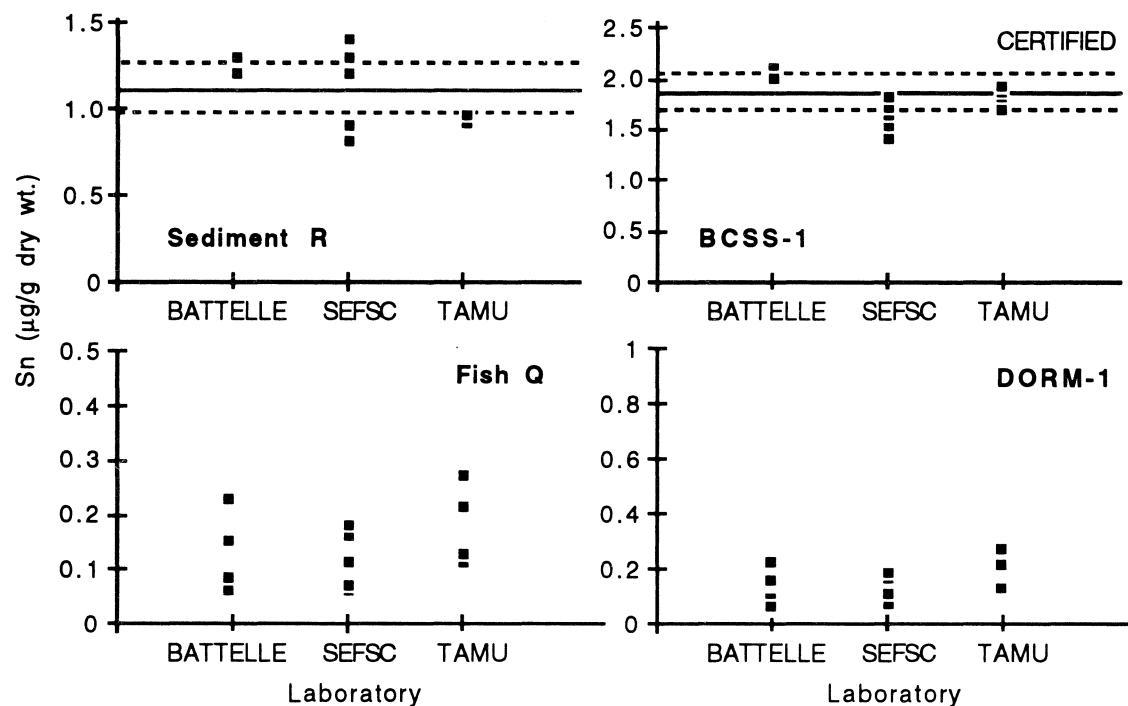

Figure 29. 1992 NOAA/6 Sn intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g dry wt.}$) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit. No certified or accepted value were available for Fish Q and DORM-1.).

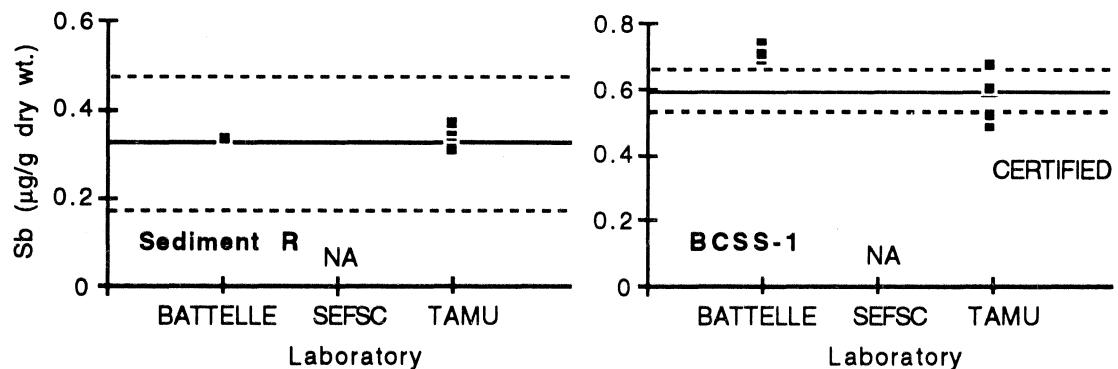

Figure 30. 1992 NOAA/6 Sb intercomparison exercise results of five replicates for Sediment R, BCSS-1, Fish Q, and DORM-1 ($\mu\text{g/g dry wt.}$) (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm uncertainty. NA - Not available.).

tissue analyses were within the confidence intervals of Fish Q and DORM-1. The results for Sediment R for Sn reported by BATTELLE and SEFSC were within the confidence interval. The mean Sn reported by TAMU for Sediment R, 0.94 µg/g, was slightly lower than the lower limit of the confidence interval, 0.97 µg/g. The Sn means reported by BATTELLE and TAMU for BCSS-1 were within the confidence interval. The mean Sn reported by SEFSC, 1.6 µg/g, was lower than the lower limit of the confidence interval, 1.85 µg/g. The concentrations of Sn in Fish Q and DORM-1 were very low and close to the tissue MDLs of the three laboratories (Table 6). Few laboratories reported results for these materials so no accepted value was calculated for Fish Q. DORM-1 is not certified for Sn. SEFSC did not submit results for Sb. The means reported by TAMU for Sediment R and BCSS-1 for Sb were within the confidence interval. Those reported by BATTELLE were within the confidence interval for Sediment R but slightly high for BCSS-1. The BATTELLE mean for BCSS-1 was 0.71 µg/g, and the upper limit of the confidence interval was 0.65 µg/g. The determination of Sb in tissues was not required.

4.2.4. Performance evaluation of NS&T laboratories

Willie and Berman (1992) summarized the results of the 1992 NOAA/6 exercise using the accuracy and precision scale previously described in Section 4.1.4 (Table 11). The same information is shown graphically in Figures 31 and 32. The performance of the NS&T laboratories was rated good to superior, although the precision of the BATTELLE results could be improved.

4.2.5. Performance evaluation of "core" and "new" laboratories

As for NOAA/5, the performance of the "core" laboratories that had previously participated in intercomparison exercises was better in most cases than that of laboratories participating for the first time. For example, the results submitted for NOAA/5 and NOAA/6 by a non-NS&T laboratory that participated in the intercomparison exercises for the first time in 1991 show improvement in analytical performance over a year's time. The mean absolute percent errors (absolute percent difference from the consensus mean) for Al, Cr, Fe, Cu, Zn, As, Se, Cd, Sn, Hg and Pb for each of the four exercise materials in each intercomparison exercise are shown in Figure 33. It is apparent that, overall, the mean absolute percent errors are smaller for the 1992 exercise than for the 1991 exercise, although there is still room for improvement. Only one material was common to both NOAA/5 and NOAA/6, BCSS-1, and with some exceptions, the mean absolute percent errors were also smaller for the CRM. This type of evaluation should be interpreted with caution since errors magnify as values decrease. Analytical errors also increase as analyte values approach MDLs.

4.3. 1993 Exercise

The seventh NS&T trace metal intercomparison exercise, NOAA/7, took place in 1993 and was coordinated by NRC. The NS&T laboratories were SEFSC, BATTELLE, and TAMU. Materials were sent to 56 other laboratories including 16 Canadian laboratories participating for the first time. The materials used were Sediment T, BCSS-1, Tissue S, and SRM 1566a. The results of the analyses are listed in Appendix III. A detailed description of the exercise and the results of the other participating laboratories can be found in Willie and Berman (1993).

Table 11. Laboratory performance evaluation for NOAA/6 (The first letter is the evaluation of the accuracy and the second of the precision.).

Accuracy:	E	-	Excellent accuracy. All replicates were within the established confidence interval.
	G	-	Good accuracy. The mean of the replicates was within the established confidence interval, but one or more of the replicates was outside.
	L	-	Low results. The mean of the replicates was less than the lower confidence interval.
	H	-	High results. The mean of the replicates was greater than the higher confidence interval.
	?	-	Accuracy could not be established.
Precision:	G	-	Good precision. The intralaboratory precision was within the following criteria for various analyte concentrations: concentration $\geq 10 \mu\text{g/g}$, expected RSD $\pm 10\%$ ($\pm 5\%$ for Al and Fe in sediments); concentration $\geq 1 - < 10 \mu\text{g/g}$, expected RSD $\pm 15\%$; and concentration $< 1 \mu\text{g/g}$, expected RSD $\pm 20\%$.
	X	-	The intralaboratory precision was not within the criteria described above.
	-	-	No results or a "less than" value submitted.

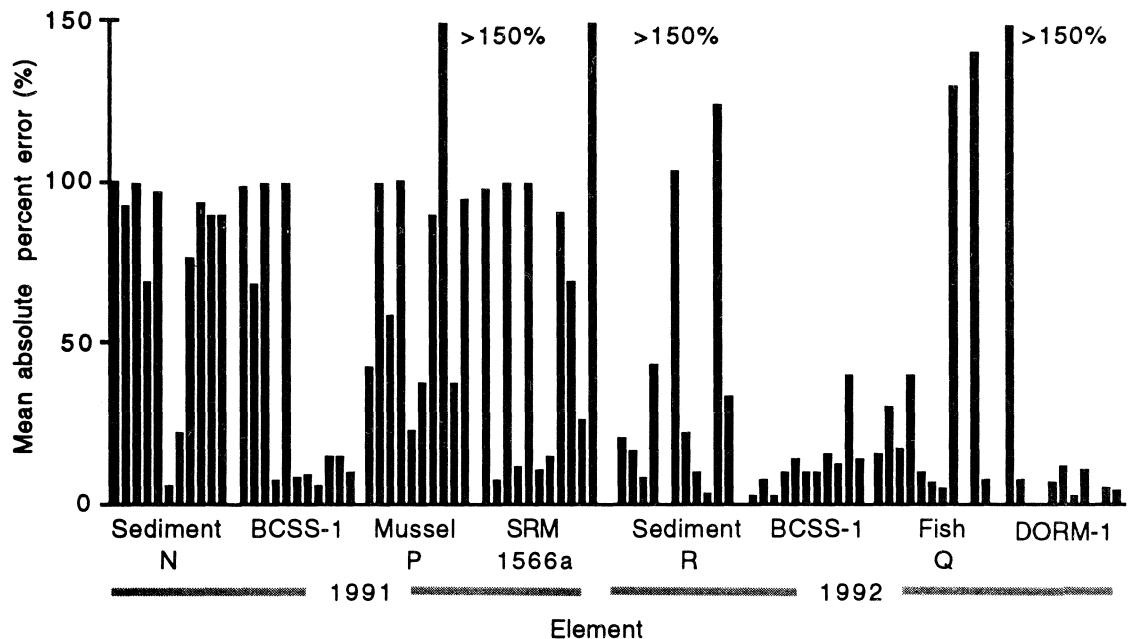

Figure 33. Absolute mean percent errors of the results of 1991 and 1992 intercomparison exercises of a laboratory participating in the exercises for the first time in 1991 (Order of elements: Al, Cr, Fe, Cu, Zn, As, Se, Cd, Sn, Hg, and Pb.).

4.3.1. Description of materials and exercise

Sediment T is a freeze-dried Mississippi Delta sediment donated by TAMU. Tissue S is a freeze-dried *Mytilus edulis* tissue homogenate collected by the International Atomic Energy Agency in the Mediterranean off the coast of France and further processed and bottled by the SRM program at NIST. Since the flounder tissue used for the NOAA/6 exercise contained low levels of contaminants, the Tissue S material was selected since it was expected to have higher levels. The control materials, BCSS-1 and SRM 1566a, were described previously.

Each laboratory received 10-g samples of each "unknown" sample and were asked to perform five replicate analysis of each of the unknowns, BCSS-1 and SRM 1566a for Al, Cr, Fe, Ni, Cu, Zn, As, Se, Ag, Cd, Sn, Hg, and Pb. The sediment materials were also to be analyzed for Be, Si, Mn, Sb and Ti. All results, including outliers, are shown graphically in Figures 34 - 47 and are listed in Appendix III. As in previous exercises, NRC provided benchmarks for accuracy.

4.3.2. "Accepted" values

Accepted values were determined as in previous exercises (Section 4.1.2).

4.3.3. Results

4.3.3.1. Al, Si, Fe, and Mn

The results of the Al, Fe and Mn analyses are shown in Figures 34, 35 and 36 respectively. The means of the Al results of the three NS&T cooperating laboratories were within the 95% confidence interval of Sediment T, BCSS-1 and Tissue S. The results of the SRM 1566a

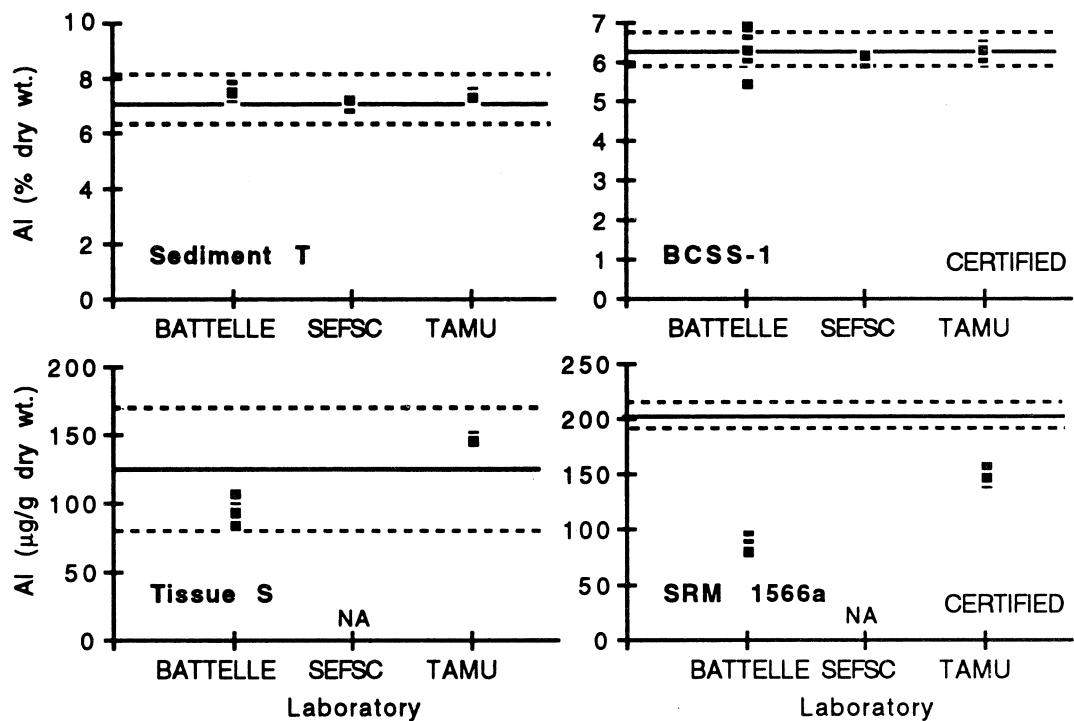

Figure 34. 1993 NOAA/7 Al intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) (% dry wt.).

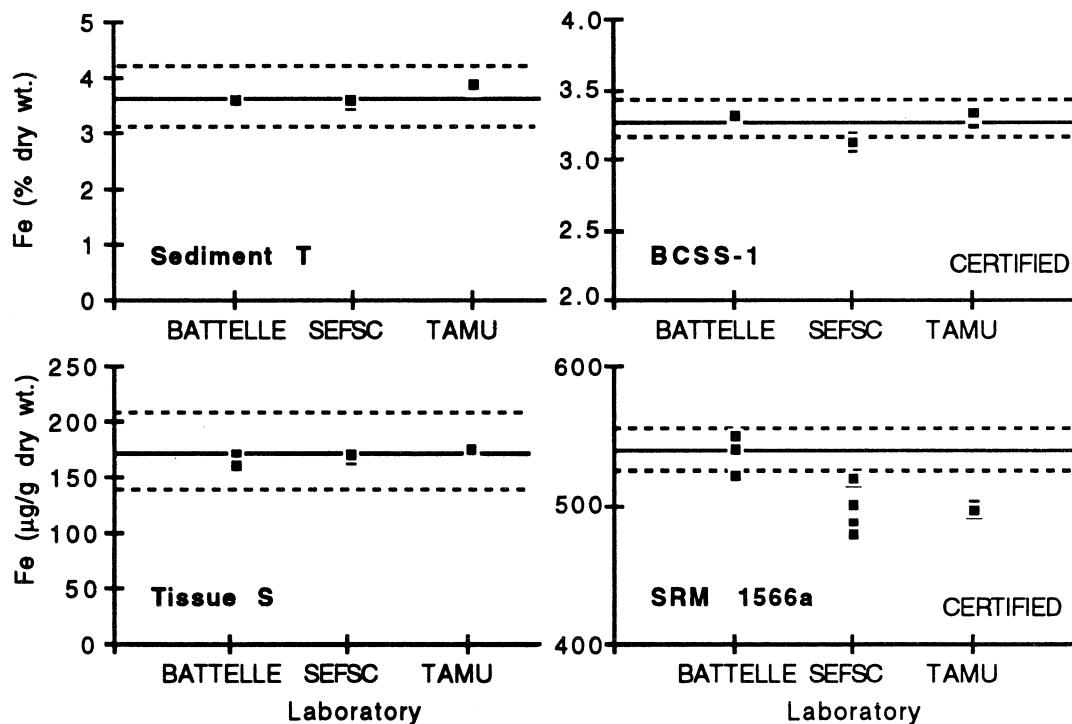

Figure 35. 1993 NOAA/7 Fe intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) (% or $\mu\text{g/g}$ dry wt. as noted).

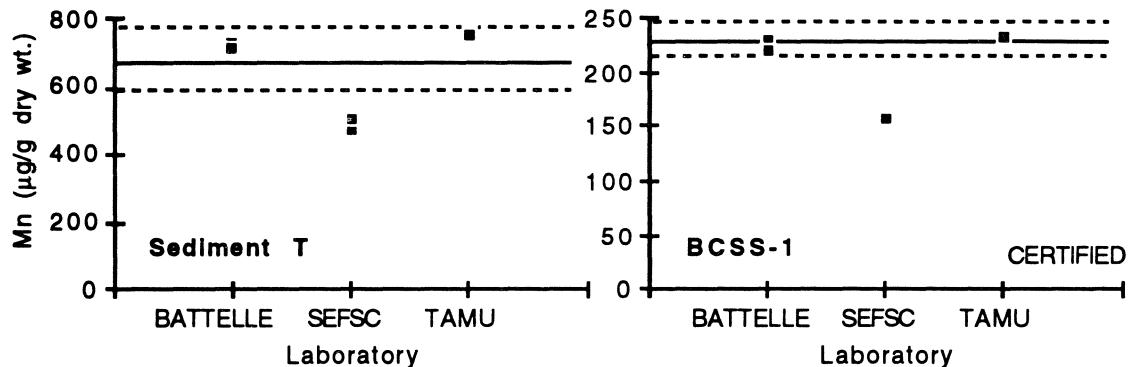

Figure 36. 1993 NOAA/7 Mn intercomparison exercise results of five replicates for Sediment T and BCSS-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt. as noted).

analyses were low for BATTELLE and TAMU. SEFSC did not report results for Al in tissues. The results of the Fe analyses are shown in Figure 35. All the mean values were within the confidence interval except for those of SEFSC and TAMU for SRM 1566a. The Mn results are shown in Figure 36. The SEFSC results were low and outside the confidence interval. No Mn analysis of the tissue materials was required. Only BATTELLE reported Si values for the sediment materials and the results were within the confidence intervals. Analysis of Si in the tissue materials was not required.

4.3.3.2. Cr, Ni, Cu, and Zn

The results of the Cr, Ni, Cu, and Zn analyses are shown in Figures 37, 38, 39, and 40, respectively. The Cr results for the sediment materials were within the confidence intervals, except for the SEFSC results for BCSS-1. The calculated concentration for Cr in Tissue S was low, 0.5 $\mu\text{g/g}$, and the confidence interval was high, $\pm 60\%$. The results of SEFSC and TAMU were within the confidence interval, and those of BATTELLE were high. For SRM 1566a, which has a comparable concentration to that of Tissue S, the BATTELLE and TAMU results were within the confidence interval and those of SEFSC were slightly low. The Ni analyses results were within the confidence intervals except for the SEFSC values for BCSS-1 and SRM 1566a (Figure 38). The mean results of the Cu analyses of all the exercise materials were within the confidence intervals, except for the mean of TAMU for Tissue S which was low. The Zn results are shown in Figure 40. The means were within the confidence intervals except for the TAMU results for Sediment T and Tissue S which were high.

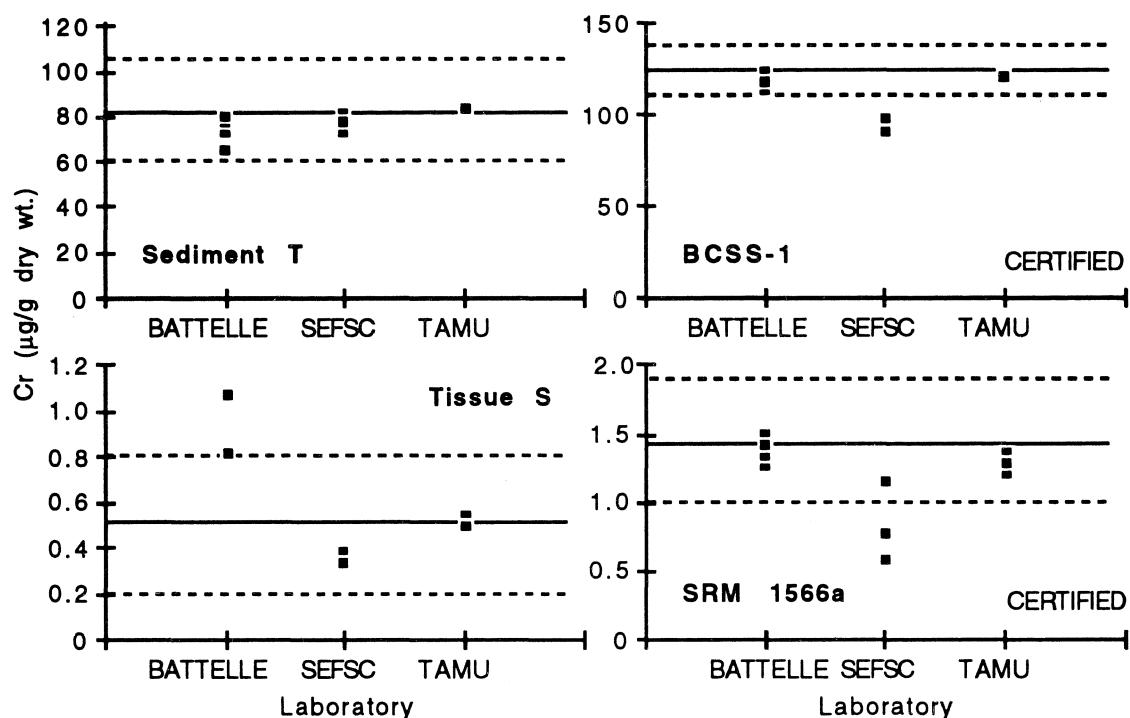

Figure 37. 1993 NOAA/7 Cr intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g dry wt.}$).

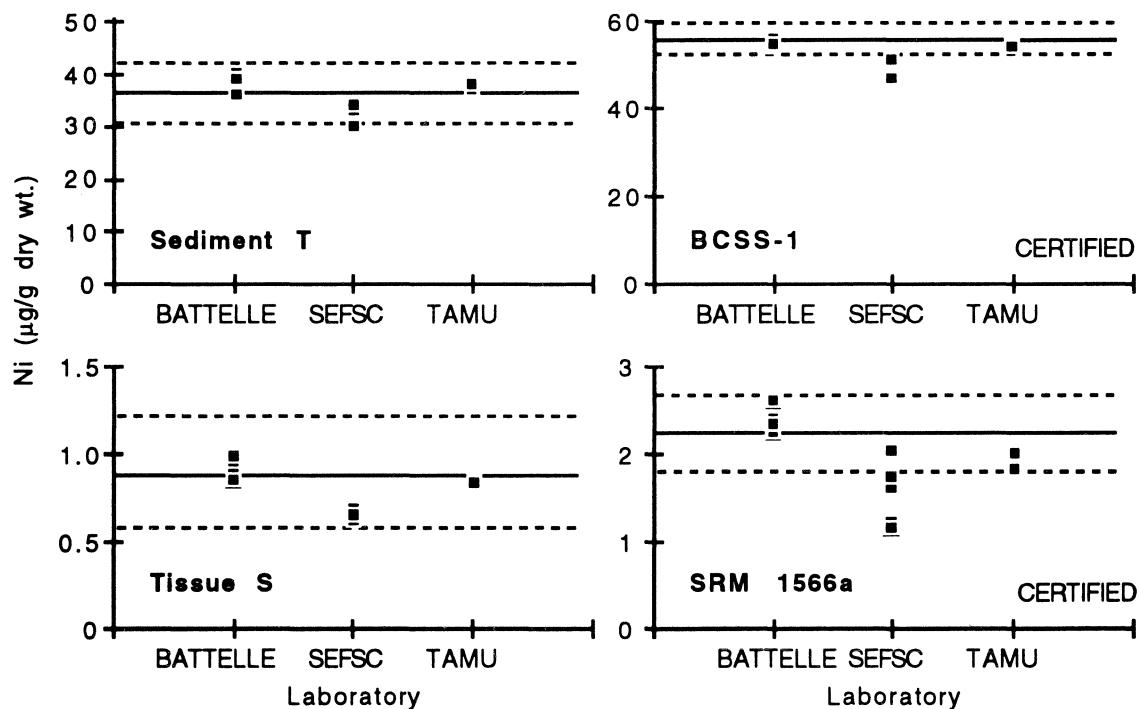

Figure 38. 1993 NOAA/7 Ni intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g dry wt.}$)

4.3.3.3. As, Cd, Ag, Hg, and Pb

The results of the As, Cd, Ag, Hg, and Pb analyses are shown in Figures 41, 42, 43, 44, and 45, respectively. The means of the As results reported by BATTELLE and TAMU were within the confidence intervals of the four exercise materials (Figure 41). The SEFSC results were within the confidence interval for Sediment T, but low for the other three materials. The results of the Cd analyses are shown in Figure 42. All the BATTELLE means were within the confidence intervals. The SEFSC results for Sediment T and BCSS-1 were within the confidence limits, but outside the confidence limits for the tissue materials. Two of the TAMU means were just outside the confidence intervals. That for Sediment T was high, and that of SRM 1566a was low. The Ag results are shown in Figure 43. BATTELLE and SEFSC reported some values below the limit of detection. The mean of the SRM 1566a analyses by BATTELLE was slightly high. The precision of the SEFSC Ag analyses was low. The Hg analyses results for BATTELLE and TAMU were within the confidence intervals (Figure 44). The mean reported by SEFSC was high and outside the confidence interval for Sediment T, and low and outside the interval for SRM 1566a. The precision of the SEFSC results was low. The means of the Pb analyses were within the confidence intervals (Figure 45). The precision for SEFSC for SRM 1566a was again low.

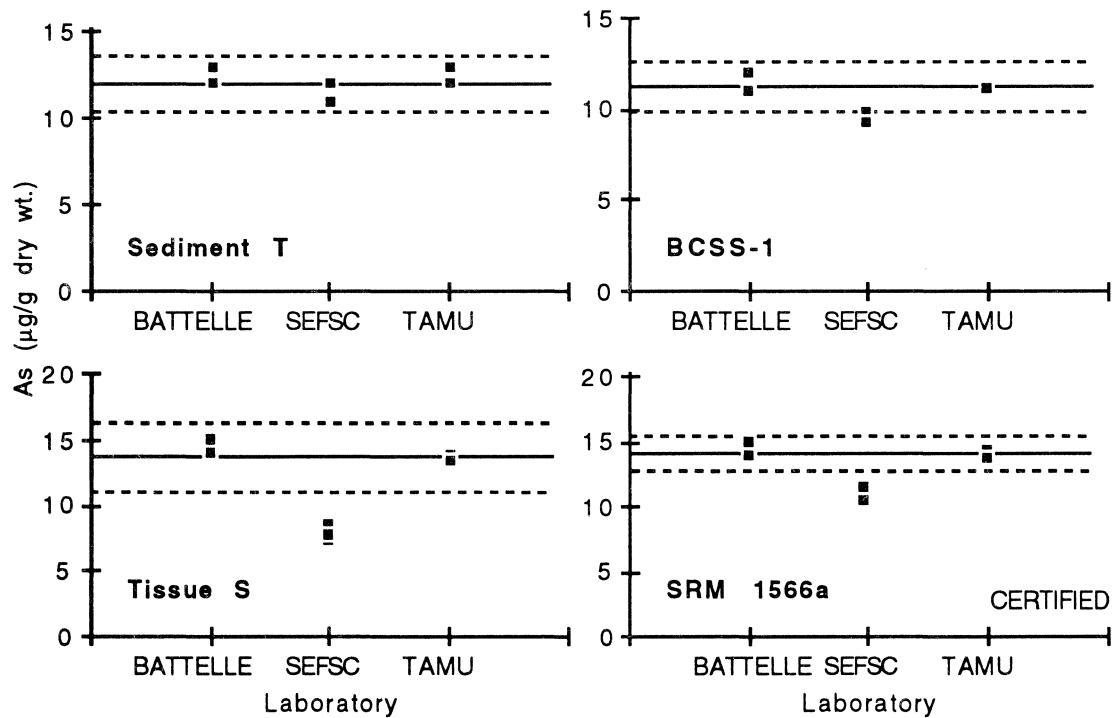

Figure 41. 1993 NOAA/7 As intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

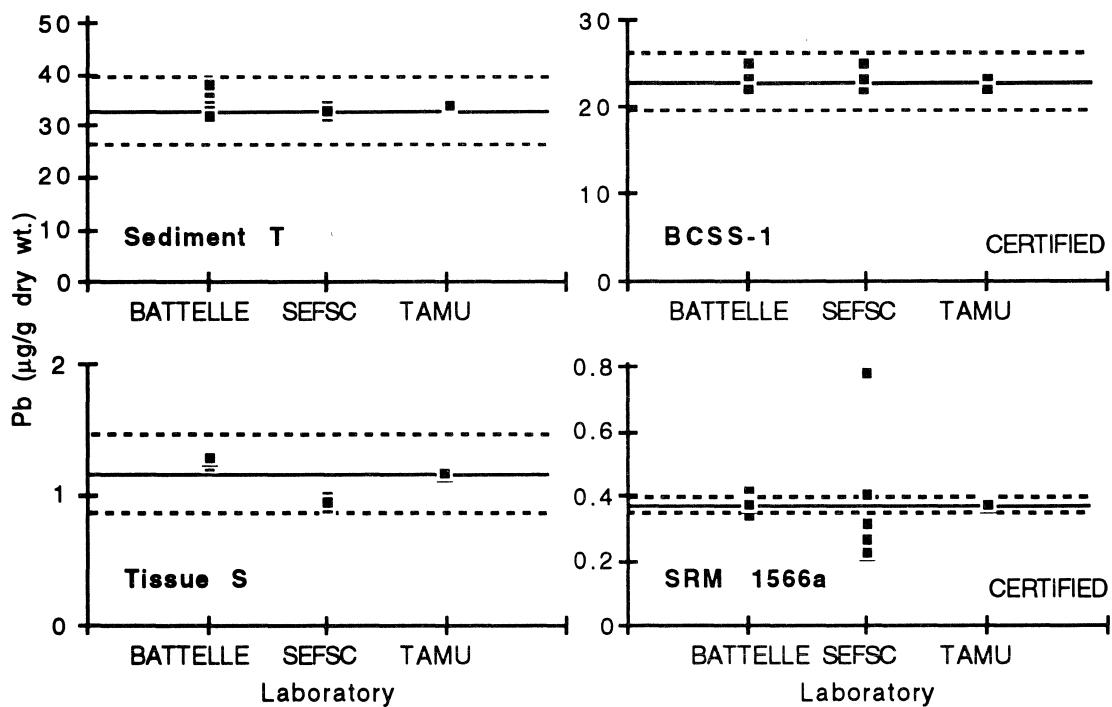

Figure 45. 1993 NOAA/7 Pb intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

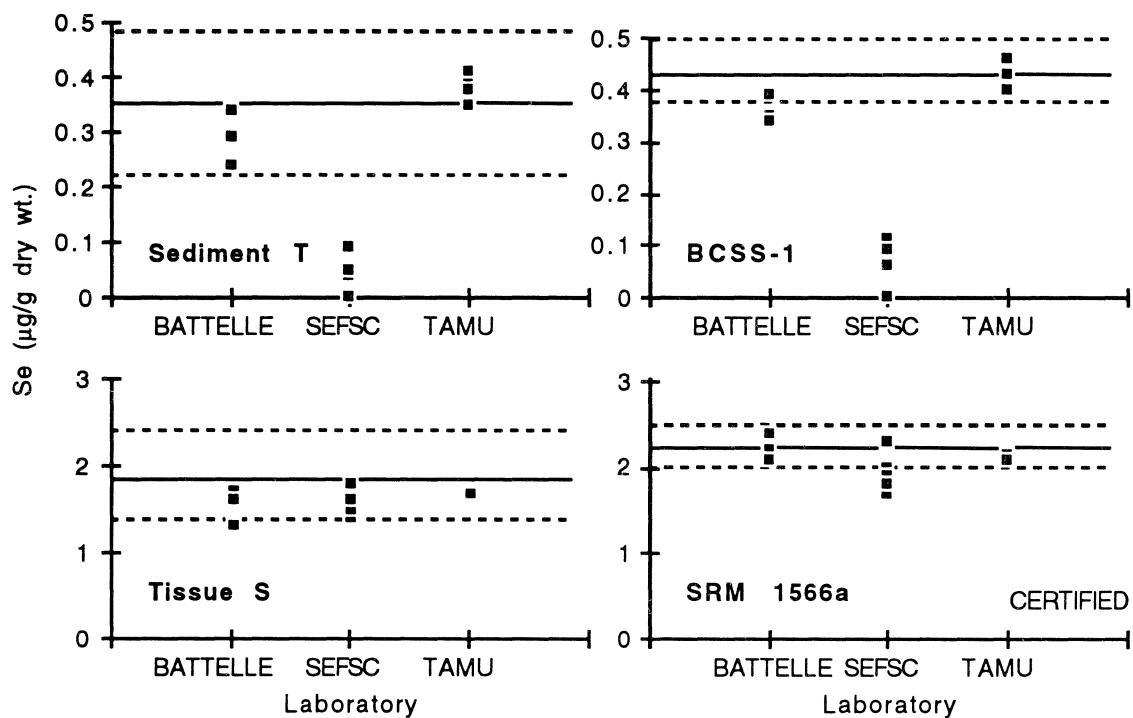

Figure 46. 1993 NOAA/7 Se intercomparison exercise results of five replicates for Sediment T, BCSS-1, Tissue S, and SRM 1566a (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

4.3.3.4. Se, Sn, and Sb

The Se results are shown in Figures 46. The means of the five replicates were within the confidence intervals, except for the BCSS-1 mean by BATTELLE which was slightly low and the SEFSC means, which were low and outside the confidence intervals for the Sediment T and BCSS-1. The Sn means for Sediment T, BCSS-1, and SRM 1566a were within the confidence intervals, except for the means of SEFSC, which were slightly low (Figure 47). The level of Sn in Tissue S was very low, $0.08 \pm 0.053 \mu\text{g/g}$. The TAMU results were low and SEFSC reported values below the limit of detection. Of the NS&T cooperating laboratories, only BATTELLE and TAMU reported results for Sb, and the results were within the confidence intervals (Figure 48).

4.3.3.5. Be

Beryllium was analyzed for the first time as part of an NS&T exercise during NOAA/7. Analysis of Be in the tissue materials was not requested. Only BATTELLE reported Be analyses results and these were within the confidence intervals of Sediment T and BCSS-1.

4.3.4. Performance evaluation of NS&T laboratories

Willie and Berman (1993) summarized the results of the 1993 NOAA/7 exercise using the accuracy and precision scale previously described in Section 4.1.4 and listed in Table 12. The same information is shown graphically in Figures 49 and 50. The performance of the NS&T laboratories was rated good to superior in most cases, although that of SEFSC could be improved.

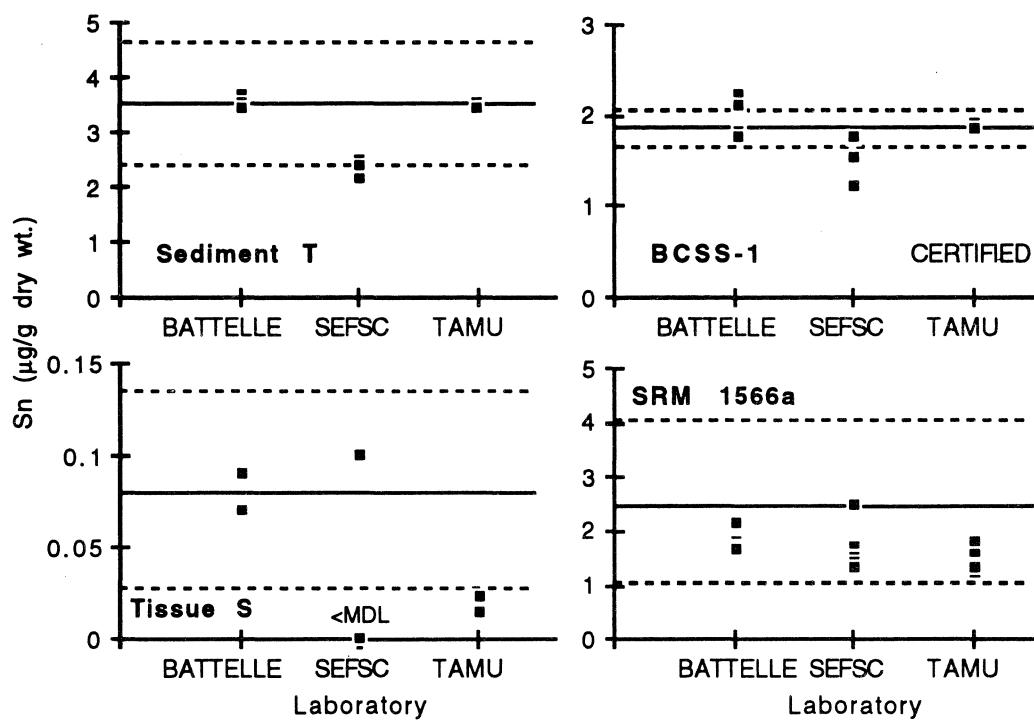

Figure 47. 1993 NOAA/7 Sn intercomparison exercise results of five replicates for Sediment T and BCSS-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is $\pm 95\%$ confidence limit.) ($\mu\text{g/g}$ dry wt.).

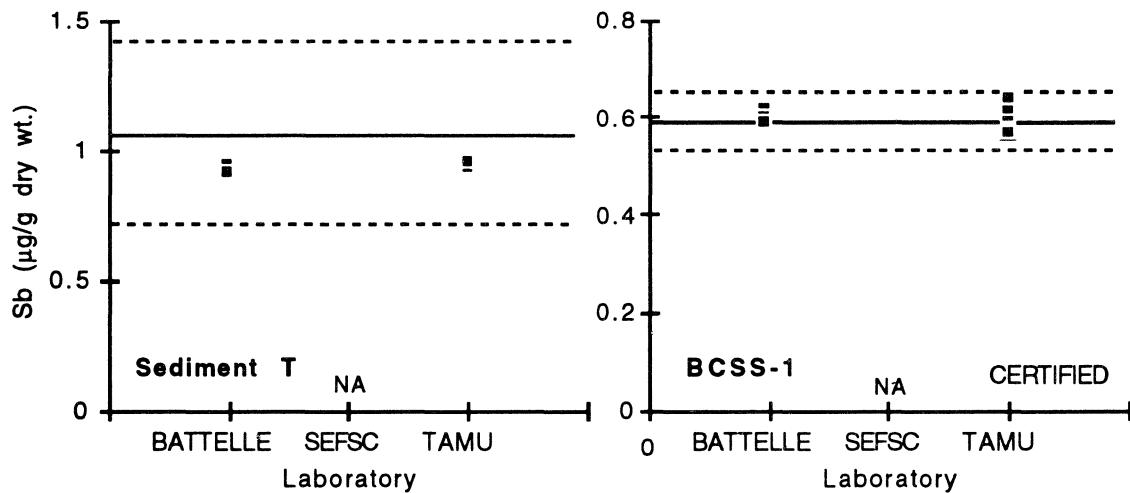

Figure 48. 1993 NOAA/7 Sb intercomparison exercise results of five replicates for Sediment T and BCSS-1 (Solid line is the certified value, if available, or the accepted value determined by NRC using exercise results. Dashed line is \pm uncertainty. NA - Not analyzed.) ($\mu\text{g/g}$ dry wt.).

4.3.5. Performance evaluation of "core" and "new" laboratories

As for the previous exercises, the performance of the "core" laboratories that had previously participated in intercomparison exercises was better in most cases than that of laboratories participating for the first time.

5. TRACE ORGANIC INTERCOMPARISON EXERCISE RESULTS

5.1. 1991 Exercise

The 1991 trace organic intercomparison exercise was organized by NIST. The materials used were prepared by NIST and were Tissue Control Material III (QC90TC) and Bivalve Tissue Extract II (QA91BE2). The NS&T cooperating laboratories were NWFSC, BATTELLE, and TAMU. Tissue Control Material III was sent to 27 other laboratories, and Bivalve Tissue Extract II to 21 other laboratories. These laboratories participated in the exercise on a voluntary basis. Results were received from 9 and 10 laboratories respectively, in addition to the NS&T cooperating laboratories. The results of the NS&T cooperating laboratories are listed in Appendix IV.

5.1.1. Description of materials and exercise

The Tissue Control Material III (QC90TC) was prepared by NIST in 1990 but not used by the NS&T cooperating laboratories until 1991. This material was a frozen bivalve tissue homogenate still containing its endogenous water. Bivalve Tissue Extract II (QA91BE2) was an accuracy-based material prepared by NIST, and was a concentrated extract of SRM 1974, Organics in Mussel Tissue. Each ampoule contained approximately 4 mL of the dichloromethane extract, equivalent to 2.36 g dry weight (19.2 g wet weight) of SRM 1974. Gravimetric amounts of one analyte of each of the three chemical classes were added to the extract to yield the following: 300 ng/ampoule of 1-methylphenanthrene (consensus value 284 ng/ampoule); 41.5 ng/ampoule of mirex (consensus value 40 ng/ampoule); and 86.6 ng/ampoule of PCB 209 (consensus value 89 ng/ampoule). The entire contents of each ampoule was used for each analysis. The results were based on the total contents of each ampoule. The weight of material in each ampoule was determined by NIST.

Each laboratory received three ampoules or jars of each unknown, and was asked to extract the materials and perform triplicate injections of the extract of a sample from one of the ampoules or jars, and single injections of the other two. Two ampoules each of concentrated PCBs (SRM 2262) and pesticides (SRM 2261), and PAHs (SRM 2260) calibration solutions were also sent to each participant. A computer diskette accompanied the samples to facilitate data reporting. The analytes determined were the organic compounds listed in Table 1. The participants were unaware of the identity of the material extracted to prepare the Bivalve Tissue Extract II.

5.1.2. Consensus values

For each analyte, the laboratory analyte means were evaluated for outliers, using the Dixon Test, and by the use of NIST expert chemical judgement after viewing both normal and log plots of the data (R. Parris, NIST, personal communication, 1994). This judgement utilized knowledge of potential coeluters based on reported analytical methods. The consensus mean was calculated as the mean of the individual laboratory analyte means with the identified outliers excluded. In a few instances in which the analyte concentration was below the detection limit of most participating laboratories, no consensus value was calculated. The exercise coordinators

Table 12. Laboratory performance evaluation for NOAA/7 (First letter is the evaluation of the accuracy and the second of the precision.).

Accuracy:	E -	Excellent accuracy. All replicates were within the established confidence interval.
	G -	Good accuracy. The mean of the replicates was within the established confidence interval, but one or more of the replicates was outside.
	L -	Low results. The mean of the replicates was less than the lower confidence interval.
	H -	High results. The mean of the replicates was greater than the higher confidence interval.
	? -	Accuracy could not be established.
Precision:	G -	Good precision. The intralaboratory precision was within the following criteria for various analyte concentrations: concentration $\geq 10 \mu\text{g/g}$, expected RSD $\pm 10\%$ ($\pm 5\%$ for Al and Fe in sediments); concentration $\geq 1 - < 10 \mu\text{g/g}$, expected RSD $\pm 15\%$; and concentration $< 1 \mu\text{g/g}$, expected RSD $\pm 20\%$.
	X -	The intralaboratory precision was not within the criteria described above.
	- -	No results or a "less than" value submitted.

recognize the limitations of using a consensus mean as the "assigned value" for evaluation of exercise results. Concurrent reference material analyses have been required for a number of years in the trace metals exercise program and have proved to be quite useful in the assessment of results. The lack of availability of appropriate CRMs or SRMs has precluded their use in this manner in the trace organic exercises, but this approach will be utilized in future exercises. The materials used in the Marine Sediment III (1992), Mussel V (1993), and Fish I (1993) exercises were candidate CRMs, and certified concentrations will be available for comparison with the consensus values for the majority of the analytes of interest.

5.1.3. Results

5.1.3.1. Tissue Control Material III (QC90TC)

The results of the intercomparison exercise reported by the NS&T cooperating laboratories are shown graphically in Figures 51 - 56.

The results of determinations of the 2- and 3-ring PAHs (low molecular weight) and the 4- and 5-ring (high molecular weight) PAHs are shown graphically in Figures 51 and 52. The compounds in each of these classes of PAHs are listed in Table 13. In these two figures and others in this section, the solid line is the consensus value calculated by NIST using the exercise results, not including outliers. The dotted line is the range defined by plus or minus one standard deviation of the consensus value, and the dashed line is $\pm 35\%$ of the high and low limits of the consensus value range. This is the limit of acceptability defined by the NS&T Program for organic compounds when the concentrations in the samples are 10 times higher than the MDL of the laboratory. The results of the laboratories were within the NS&T specified range, and most were within the smaller range defined as plus or minus one standard deviation of the consensus value. It is also important to note that the concentrations of most analytes were at low ng/g dry weight range, which makes it especially difficult to produce precise and accurate data.

The results of the PCB congener determinations are shown in Figure 53. Similar results to those of the PAHs were obtained. Except in a few instances, the results were within the NS&T

Table 13. Polycyclic aromatic hydrocarbons molecular weight categories used in the NS&T Program.

Low molecular weight PAHs (2- and 3-ring structures)	High molecular weight PAHs (4- and 5-rings)
1-Methylnaphthalene	Benzo[a]pyrene
1-Methylphenanthrene	Benzo[b]fluoranthene
1,6,7-Trimethylnaphthalene	Benzo[e]pyrene
2,6-Dimethylnaphthalene	Benzo[gh]perylene
2-Methylnaphthalene	Benzo[k]fluoranthene
Acenaphthene	Benz[a]anthracene
Acenaphthylene	Chrysene
Anthracene	Dibenzo[a,h]anthracene
Biphenyl	Fluoranthene
Fluorene	Indeno[1,2,3-cd]pyrene
Naphthalene	Perylene
Phenanthrene	Pyrene

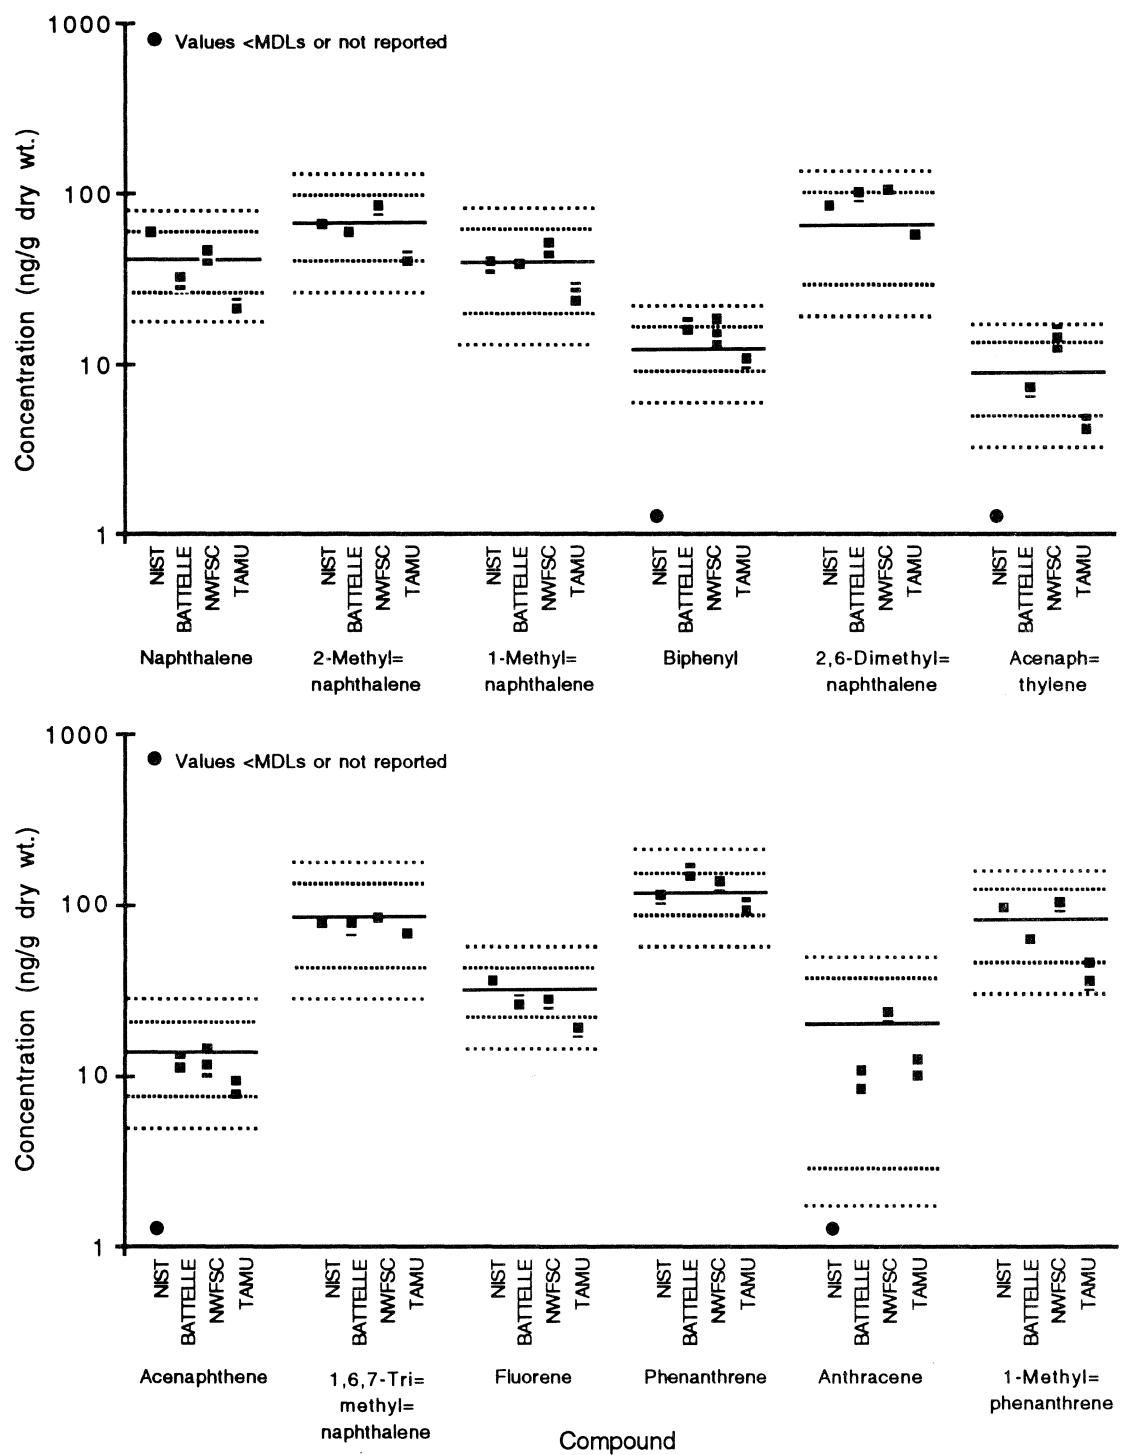

Figure 51. 1991 Tissue Control material (QA90TC) intercomparison exercise results of low molecular weight PAHs (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

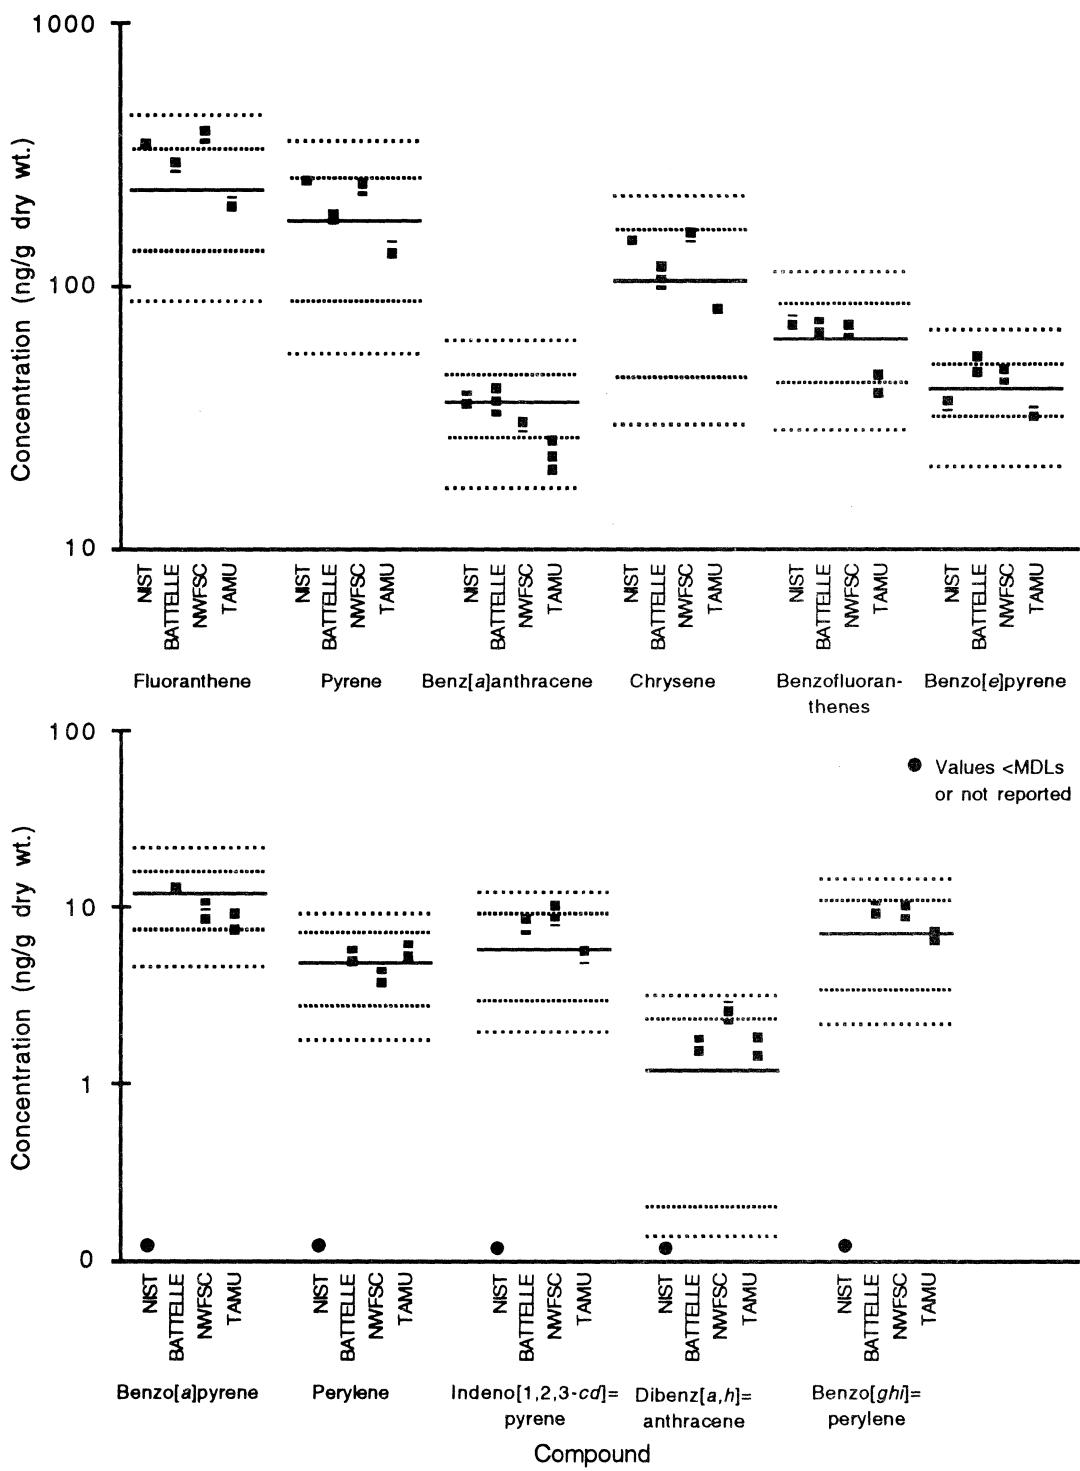

Figure 52. 1991 Tissue Control material (QA90TC) intercomparison exercise results of high molecular weight PAHs (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

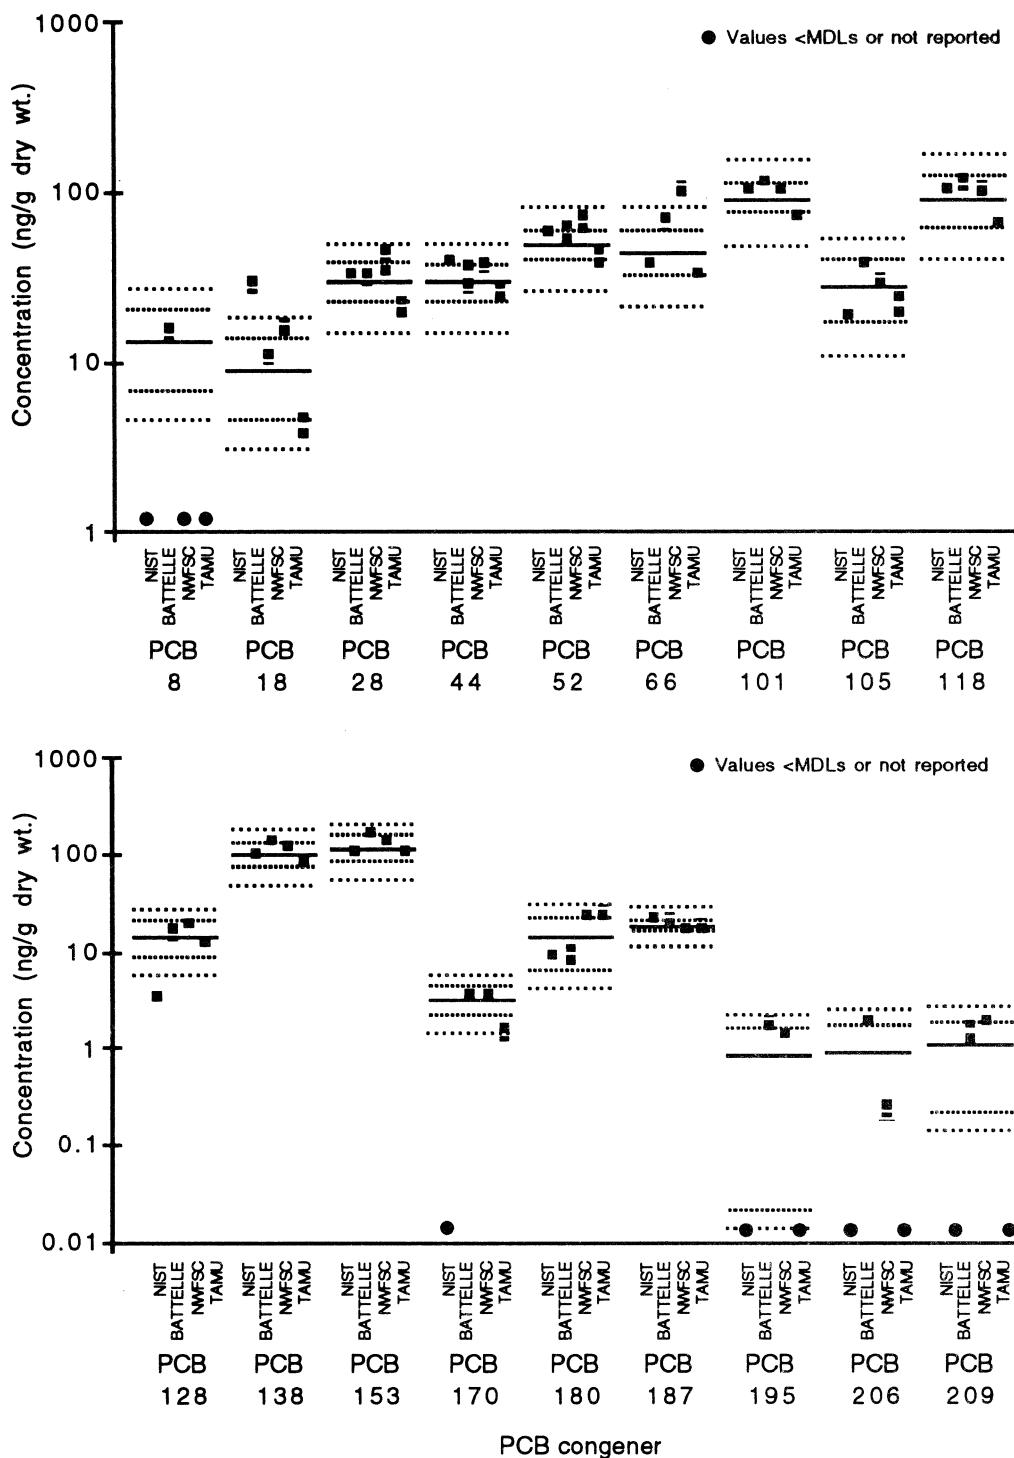

Figure 53. 1991 Tissue Control material (QA90TC) intercomparison exercise results of PCB congener analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

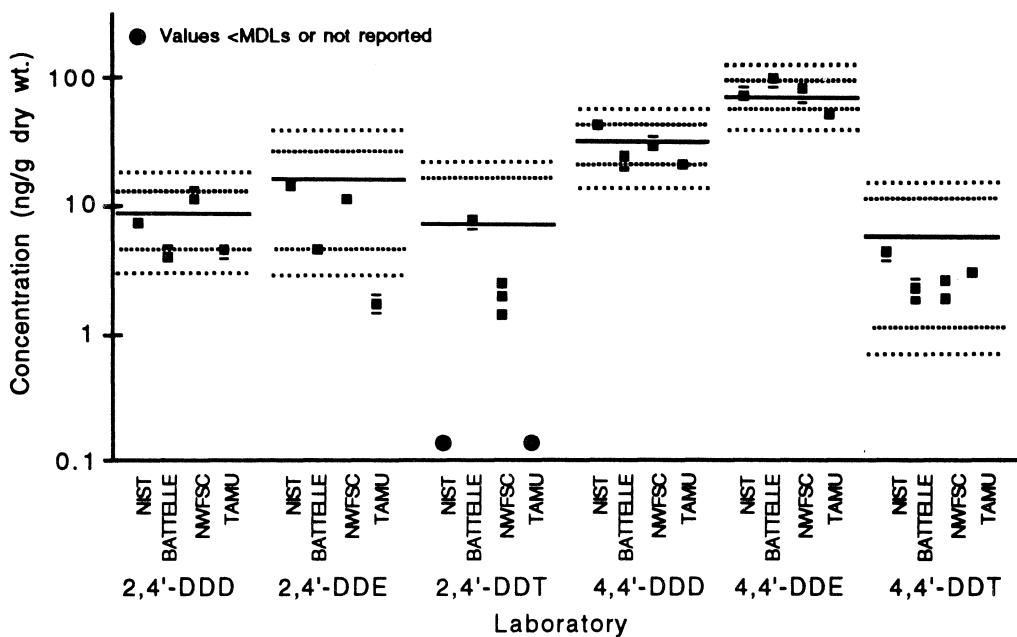

Figure 54. 1991 Tissue Control material (QA90TC) intercomparison exercise results of DDT and metabolite analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

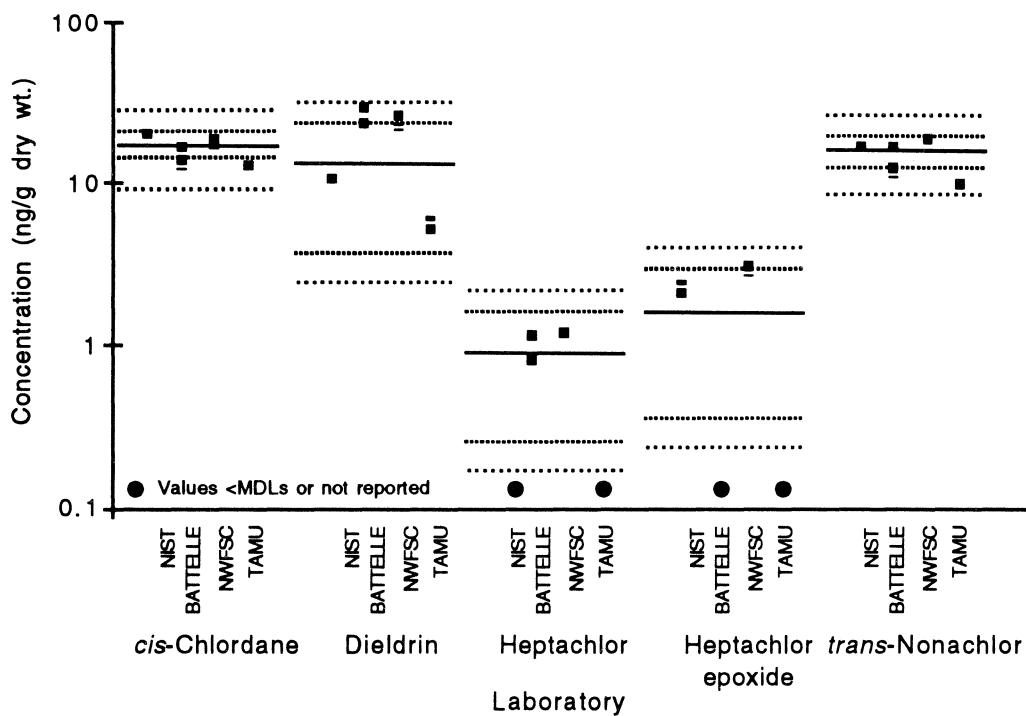

Figure 55. 1991 Tissue Control material (QA90TC) intercomparison exercise results of cyclopentadiene pesticide analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

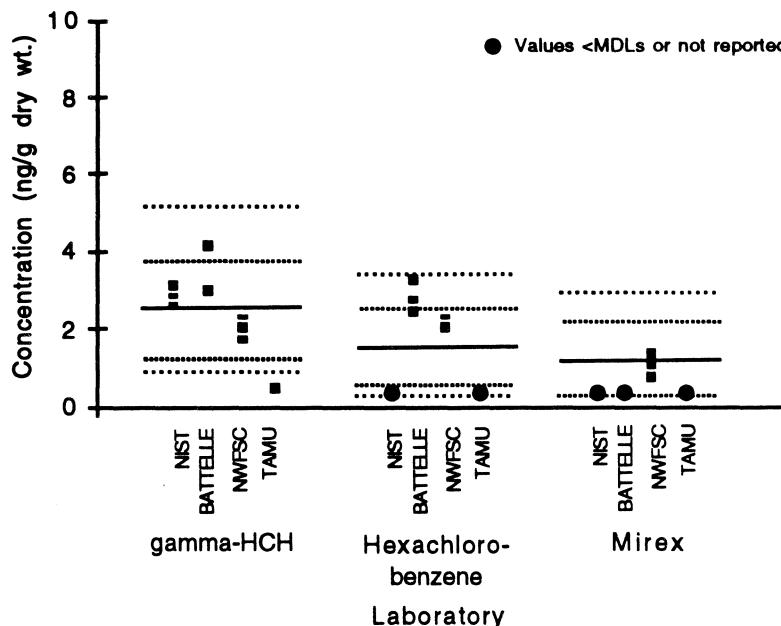

Figure 56. 1991 Tissue Control material (QA90TC) intercomparison exercise results of gamma-HCH, hexachlorobenzene and mirex analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

specified range and most were within the smaller range defined by the consensus value, plus or minus one standard deviation. The results of DDT and metabolites are shown in Figure 54. All results were within the NS&T specified range except for those of 2,4'-DDE for TAMU. The 2,4'-DDT levels in the tissue control material were very low, and NIST and TAMU reported values below the MDL. The results for *cis*-chlordane, dieldrin, heptachlor, heptachlor epoxide and *trans*-nonachlor are shown in Figure 55. These cyclopentadiene compounds have similar structures and thus are shown together. All results were within the NS&T specified range. The results of analyses of the other pesticides in the NS&T analyte list, gamma-HCH, hexachlorobenzene and mirex, are shown in Figure 56. The levels of these pesticides in the tissue control material were low and several laboratories reported values below the MDL. The results were within the specified range except for those reported by TAMU for gamma-HCH. To determine if there is any bias in the analyses, the ratios of the analytically determined mean values to those of the consensus values are shown in Figures 57 - 59. The order of the analytes is the same as those in Appendix IV. TAMU results are biased low for PAHs, PCBs, and chlorinated pesticides. BATTELLE and NWFSC results are biased high for PCBs.

5.1.3.2. Bivalve Tissue Extract II (QA91BE2)

The Bivalve Tissue Extract II (QA91BE2) sample had a large number of potential interfering compounds so the participating laboratories had to remove the interferences and perform a class separation prior to measurement. This exercise follows the 1990 Enriched Bivalve Tissue Extract (QA90E1) which was intended as an intermediate step of difficulty between a gravimetric solution and a "real" sample (Cantillo and Parris, 1993). Concentrations were reported on a per ampoule basis, and can be converted to ng/g dry weight by dividing the per ampoule value by 2.36.

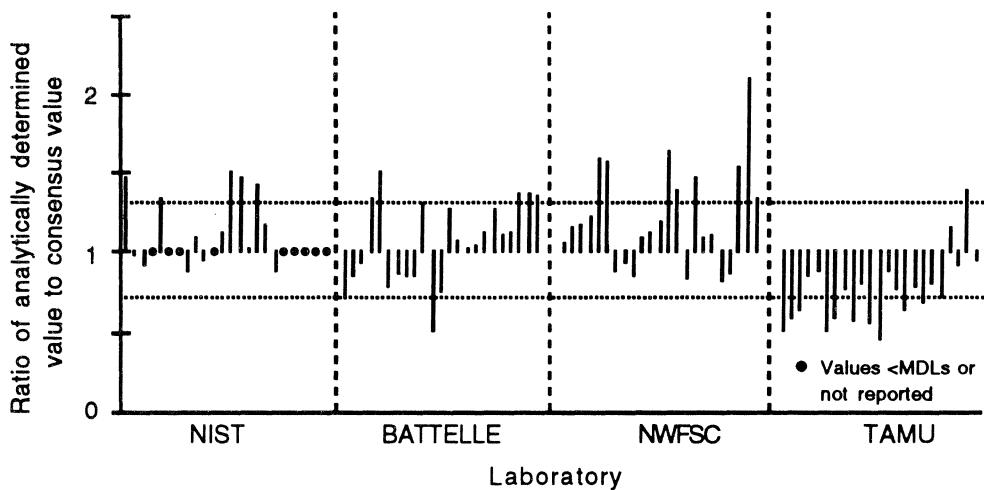

Figure 57. 1991 Tissue Control material (QA90TC) intercomparison exercise PAHs ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table IV.1, Appendix IV. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

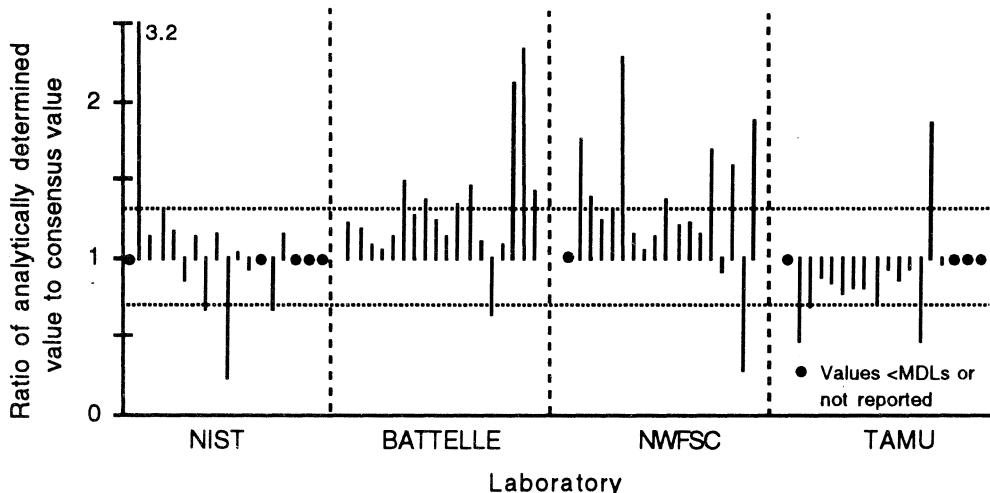

Figure 58. 1991 Tissue Control material (QA90TC) intercomparison exercise PCB congener ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table IV.1, Appendix IV. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

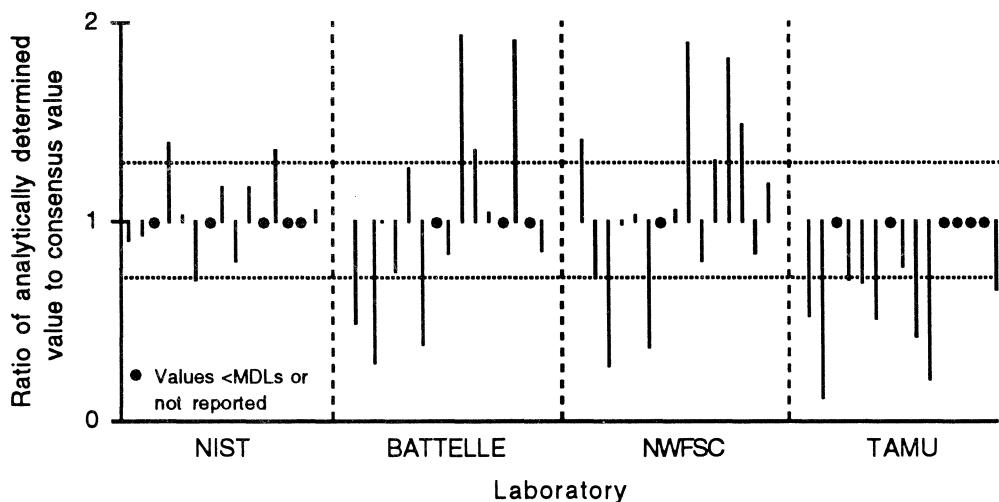

Figure 59. 1991 Tissue Control material (QA90TC) intercomparison exercise pesticides ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table IV.1, Appendix IV. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

The results of the low and high molecular weight PAH analysis are shown in Figures 60 and 61, respectively. Most of the results submitted by NWFSC were slightly high, with the mean of the replicates above the consensus value range defined as the consensus value plus or minus one standard deviation. The mean value reported by NWFSC for naphthalene, however, was considerably higher than the consensus value. Slightly high values were also reported by BATTELLE for phenanthrene. Slightly low means were reported by BATTELLE for 1,6,7-trimethylnaphthalene; and by TAMU for phenanthrene and anthracene. These values were above the MDLs listed in Table 14.

The results of the PCB congener analyses are shown in Figure 62. Relatively higher values were submitted by BATTELLE for PCB congeners 44, 52, 66, 101, 153, and 170. Apparent mean absolute percent errors ranged from 12 to 42%, except for the PCB 170 results which had a percent error of 73%. The concentration of this congener in the bivalve extract was very low in comparison with the levels of the other congeners. The consensus value for PCB 170 was 7.8 ng/ampoule. Only PCB 195 and PCB 206 were present at lower levels, below the limit of detection of BATTELLE and NMFSC (Table 15). The mean submitted by TAMU for PCB 206 was slightly high. The consensus value for this analyte was low and close to the MDL. The absolute percent errors of these results were less than 27%.

The results of the DDT and metabolite analyses are shown in Figure 63. Typical MDLs for the participating laboratories are listed in Table 16. Only four means were below the consensus value range. The means submitted by TAMU for 2,4'-DDT and 4,4'-DDD were low, and the mean submitted by TAMU for 2,4'-DDD was below the NS&T limit of acceptability. The mean submitted by NWFSC for 4,4'-DDE was low. The concentration of 2,4'-DDE in the extract was below the MDLs of BATTELLE and TAMU. The results of the cyclopentadiene (aldrin, *cis*-chlordane, dieldrin, heptachlor, heptachlor epoxide, and *trans*-nonachlor) pesticides are shown in Figures 64. The concentration of aldrin and heptachlor were below detection for BATTELLE

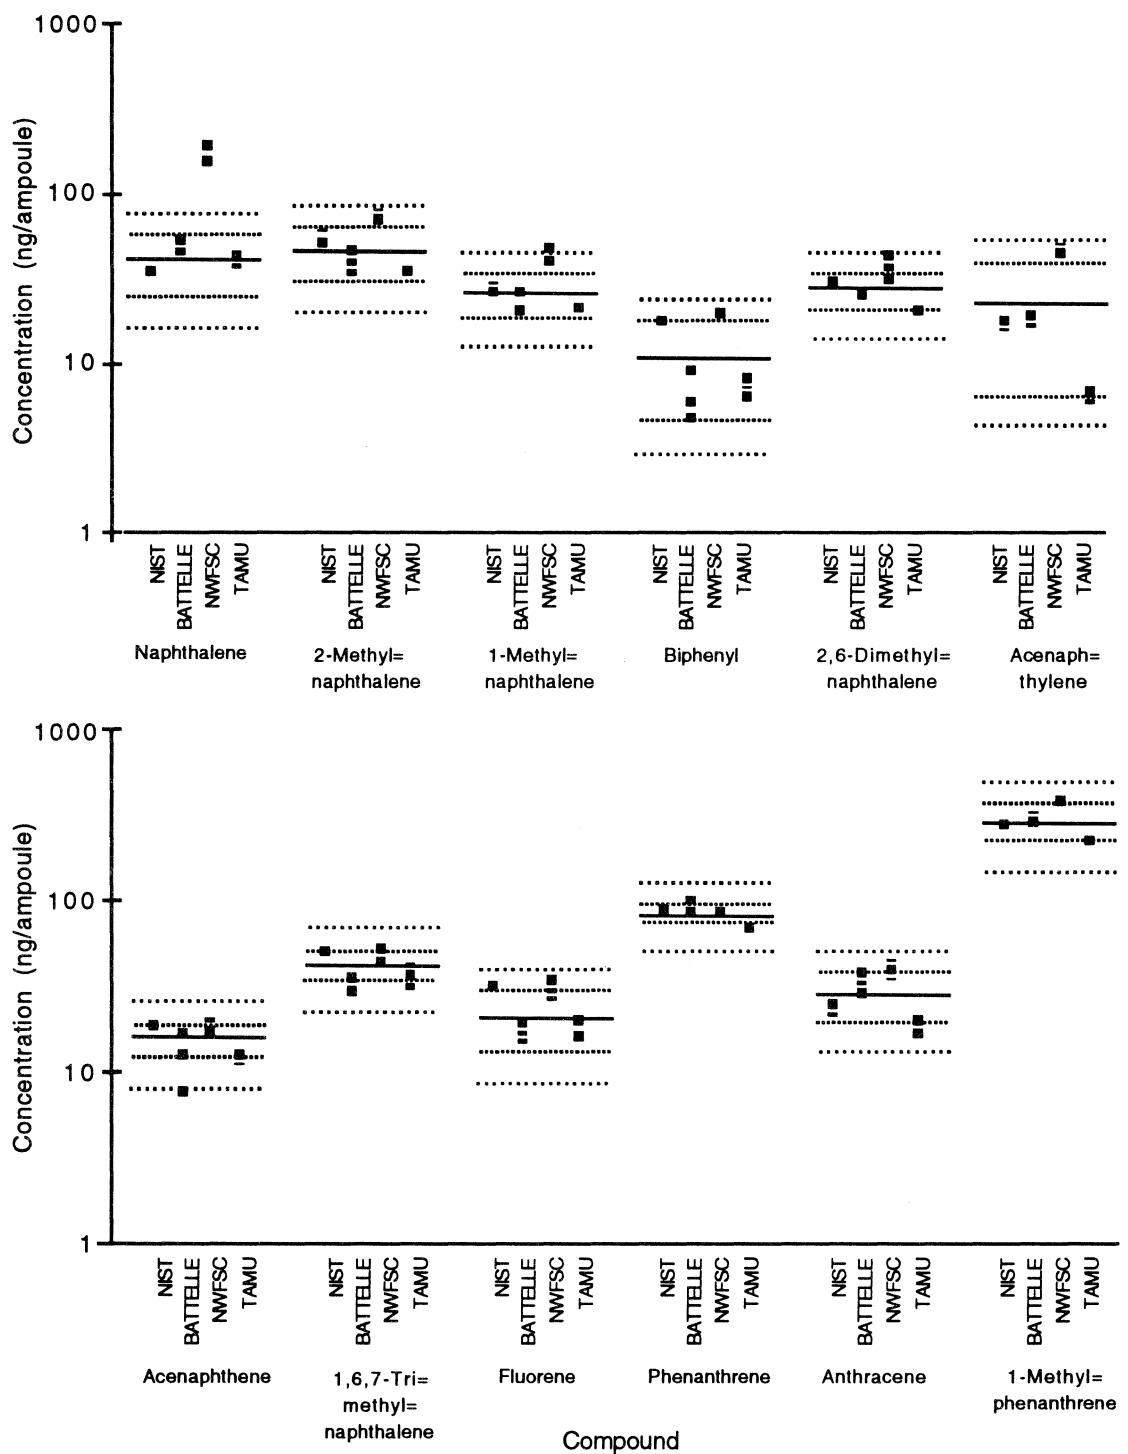

Figure 60. 1991 Bivalve Extract II (QA91BE2) intercomparison exercise results of low molecular weight PAHs (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range.) (ng/ampoule.).

♀ Brooks et al. (1990). † Battelle, 1992. § GERM , 1992b. + SIM detector, mussel samples. Battelle (in press).

* The actual detection limit for an individual analyte in a sample depends on factors such as the procedure used to analyze the sample, the sample weight, the percent dry weight, the smallest GC peak area of any detected analyte in the appropriate GC calibration solution with the lowest concentration analyzed with the sample, and the GC detector response to the individual analyte relative to the GC internal standard. Approximate 1993 detection limits for sediments based on a 10 g sample size and a 60% dry weight are 2 to <8 ng/g for PAHs. Stomach contents detection limits for a sample of 3 g and 20% dry weight were 0.3 to <2 ng/g for aromatic hydrocarbons (C. Sloan, NOAA/NMFS/NWFSC, Seattle, WA, personal communication, 1993.).

* The actual detection limit for an individual analyte in a sample depends on factors such as the procedure used to analyze the sample, the sample weight, the percent dry weight, the smallest GC peak area of any detected analyte in the appropriate GC calibration solution with the lowest concentration analyzed with the sample, and the GC detector response to the individual analyte relative to the GC internal standard. Approximate 1993 detection limits for sediments based on a 10 g sample size and a 60% dry weight are 0.2 to <2 ng/g for chlorinated hydrocarbons. The approximate 1993 detection limits for livers based on a 3 g sample size and a 30% dry weight are 0.5 to <5 ng/g for chlorinated hydrocarbons. Stomach contents detection limits for a sample of 3 g and 20% dry weight were 0.5 to <5 µg/g for chlorinated hydrocarbons (C. Sloan, NOAA/NMFS/NWFSC, Seattle, WA, personal communication, 1993.).

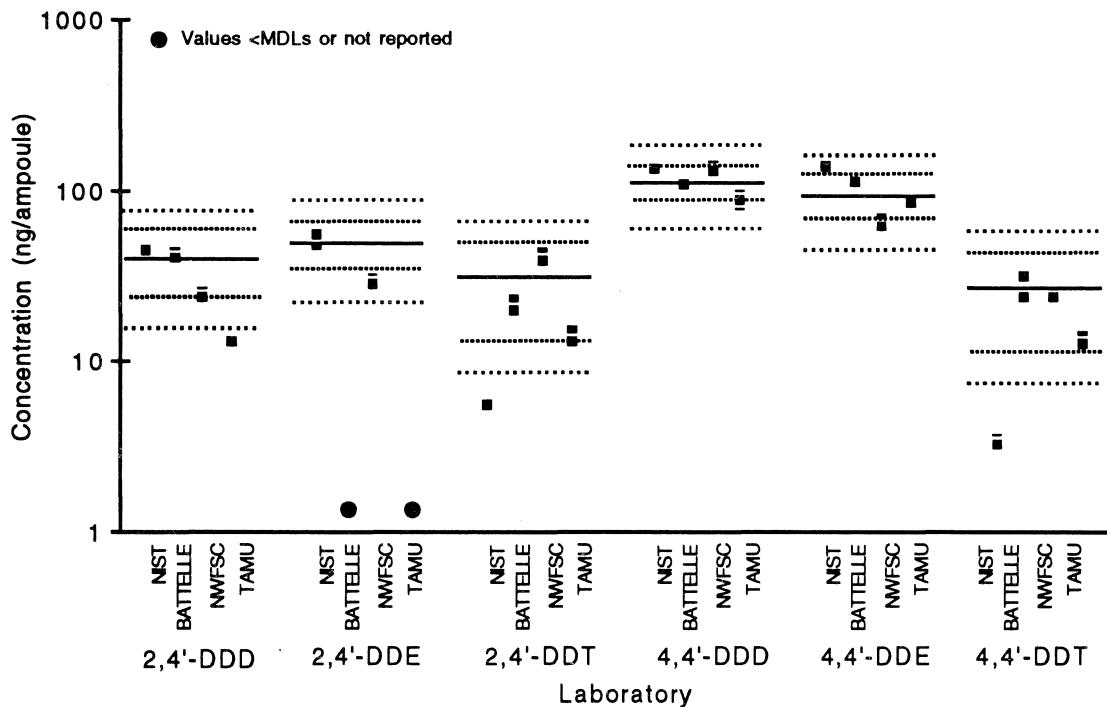

Figure 63. 1991 Bivalve Extract II (QA91BE2) intercomparison exercise results of DDT and metabolite analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/ampoule).

and NWFSC; and of heptachlor epoxide for BATTELLE. The BATTELLE means for *cis*-chlordane, dieldrin, and *trans*-nonachlor were higher than the consensus values. Slightly high means were also submitted by NWFSC for heptachlor epoxide, and *trans*-nonachlor. The level of heptachlor epoxide in the Bivalve Tissue Extract II was low and was not detected by one of the participating laboratories. The results of the mirex and hexachlorobenzene analyses are shown in Figure 65. High means were reported by NWFSC for mirex and by BATTELLE for hexachlorobenzene. The concentration of aldrin in the Bivalve Tissue Extract II was below the limit of detection of the three NS&T cooperating laboratories.

To determine if there is any bias in the analyses of this material, the ratios of the analytically determined mean values to those of the consensus values are shown in Figure 66 - 68. The order of the analytes is the same as those in Appendix IV. TAMU results are biased low for PAHs, but most of the results are within $\pm 30\%$ of the consensus values. NWFSC PAH results are biased high and about a third of the results are above 30% of the consensus value. The low concentration range of PAHs, however, presented analytical difficulties and the bias observed in the analytical results of one set of samples is not representative of the bias of the laboratory results overall. The PAH results for BATTELLE were within the $\pm 30\%$ range with only one exception. The BATTELLE results for PCB congener analysis were biased high with some results higher than 30% of the consensus value (Figure 67). The results for NWFSC and TAMU were within the 30% range with only a few exceptions. The concentrations of chlorinated pesticides in the Bivalve Tissue Extract were very low and many of the laboratories reported values below the MDLs. All three cooperating laboratories reported some values outside the $\pm 30\%$ range of the consensus value (Figure 68), and the results reported by TAMU seems to be biased low.

Circles indicate values below the MDLs or not submitted.).

5.1.4. Performance evaluation of NS&T laboratories

An accuracy and precision scale similar to the one devised by Willie and Berman (1991, 1992, and 1993) in Sections 4.1.4, 4.2.4 and 4.3.4 was used to evaluate the performance of the NS&T cooperating laboratories. Accuracy was considered excellent if all replicates were within the range defined by the consensus value calculated by NIST using exercise results plus or minus one standard deviation, and good if the mean of the replicates was within the defined range but one or more of the replicates was outside. Further, results above or below the NS&T limits of acceptability are noted. Results were considered low or high if the mean of the replicates was lower or higher than the defined range. Precision was evaluated using the following criteria for various analyte concentrations: for concentrations ≥ 50 ng/g, the expected %RSD was $\pm 10\%$; for concentrations $\geq 20 - < 50$ ng/g, the expected %RSD was $\pm 20\%$; and for concentrations < 20 ng/g, the expected %RSD was $\pm 40\%$. The results of this evaluation are shown in Table 17. The same results are shown graphically in Figure 69 - 71. This graphical presentation does not take into account the concentration of the analyte in the exercise materials when compared to the MDLs of the participating laboratories. Typically, as the analyte concentration approaches the MDL of a method, the error increases.

The PAH analyses results reported by NWFSC for the Bivalve Extract II (QA91BE2) were biased high (Figure 66) and this is again shown in Figure 69. Some of the PAH analyses results reported by TAMU for the Tissue Control Material III (QC90TC) were low, and this was also shown in Figure 57. NIST was unable to quantitate many of the PAHs in the Tissue Control Material III since the concentrations of many of these compounds were below the detection

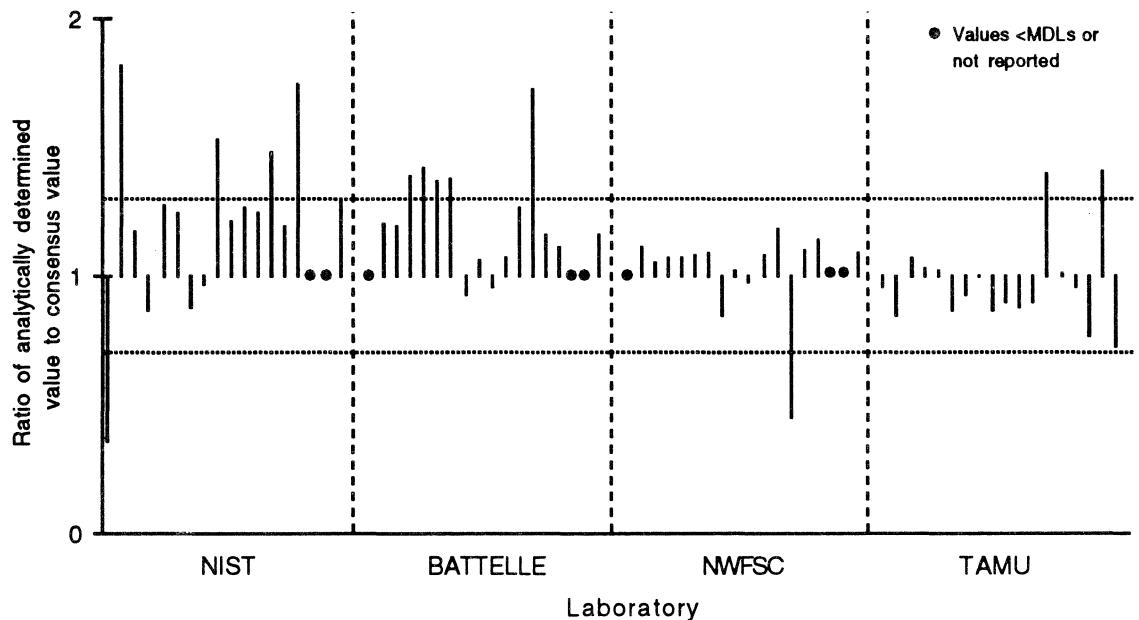

Figure 67. 1991 Bivalve Extract II (QA91BE2) intercomparison exercise PCB congener ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table IV.2, Appendix IV Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

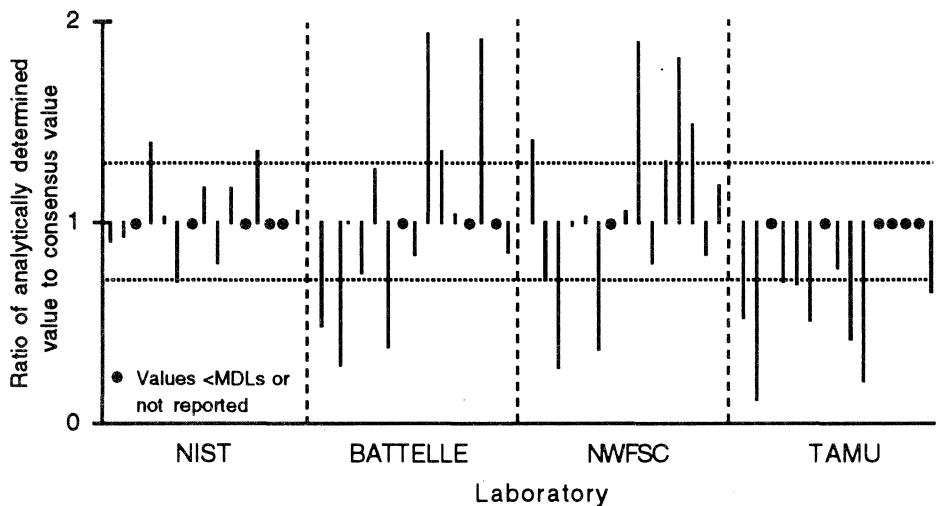

Figure 68. 1991 Bivalve Extract II (QA91BE2) intercomparison exercise pesticides ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table IV.2, Appendix IV Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

Table 17. Laboratory performance evaluation for 1991 trace organic intercomparison exercise (First letter is the evaluation of the accuracy and the second of the precision.).

Accuracy:	E	-	Excellent accuracy. All replicates are within the range defined by the consensus value calculated by NIST using exercise results plus or minus one standard deviation.
	G	-	Good accuracy. The mean of the replicates is within the range defined by the consensus value plus or minus one standard deviation, but one or more of the replicates is outside.
	L	-	Low results. The mean of the replicates is lower than the defined range.
	L-	-	Results lower than -30% of the lower limit of the defined range.
	H	-	High results. The mean of the replicates is larger than the defined range.
	H+	-	Results higher than +30% of the higher limit of the defined range.
Precision:	G	-	Good precision. The intralaboratory precision is within the following criteria for various analyte concentrations: Concentration ≥ 50 ng/g, expected RSD $\pm 10\%$; concentration $\geq 20 - < 50$ ng/g, expected RSD $\pm 20\%$; and concentration < 20 ng/g, expected RSD $\pm 40\%$
	X	-	The intralaboratory precision is not within the criteria described above.
	-	-	No results or a "less than" value submitted.

Accuracy	Precision
█ Excellent accuracy.	█ Good precision. RSD varies from $\pm 5\%$ to $\pm 40\%$ depending on concentration ranges.
☒ Good accuracy. One or more replicates outside range, mean is within.	☒ Poor precision.
☒ Low results. Mean is below range.	
☒ High results. Mean is above range.	

Figure 69. 1991 PAH determination performance evaluation.

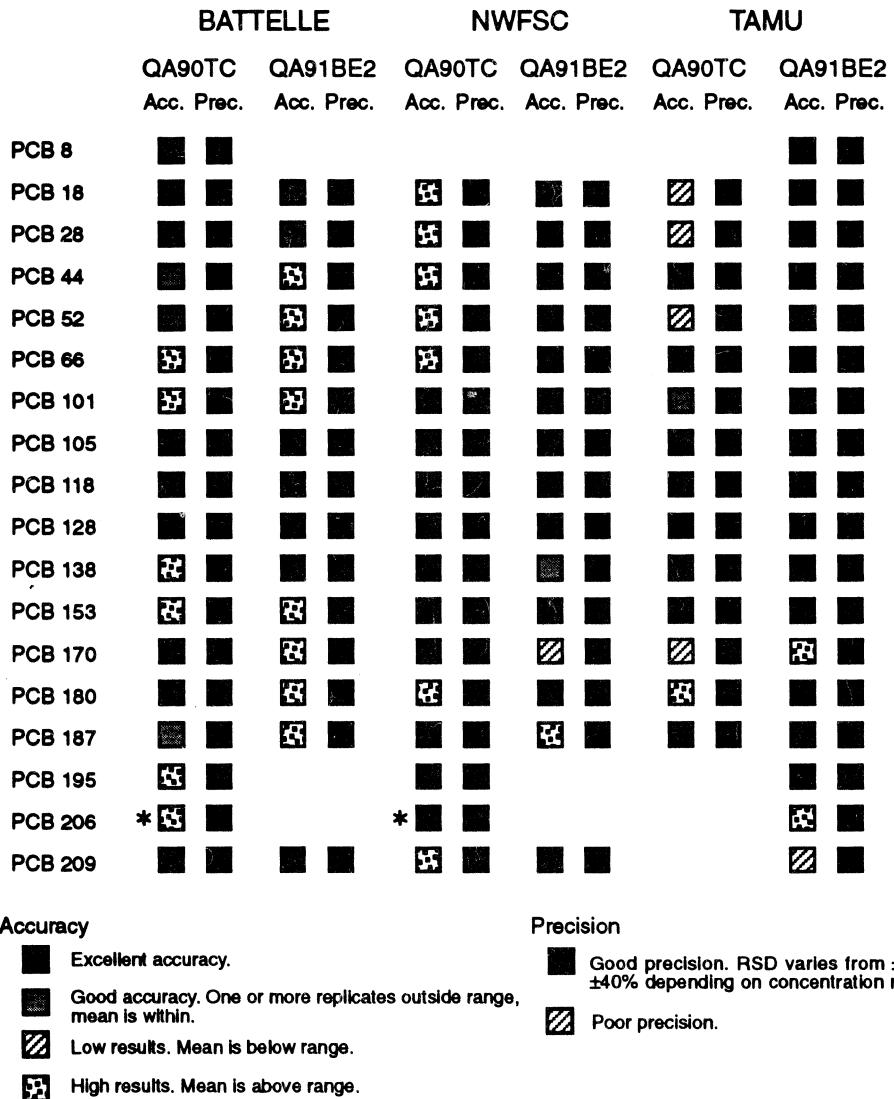

Figure 70. 1991 PCB determination performance evaluation (* - Consensus value low and standard deviation high, so lower limit of accepted concentration range is negative.).

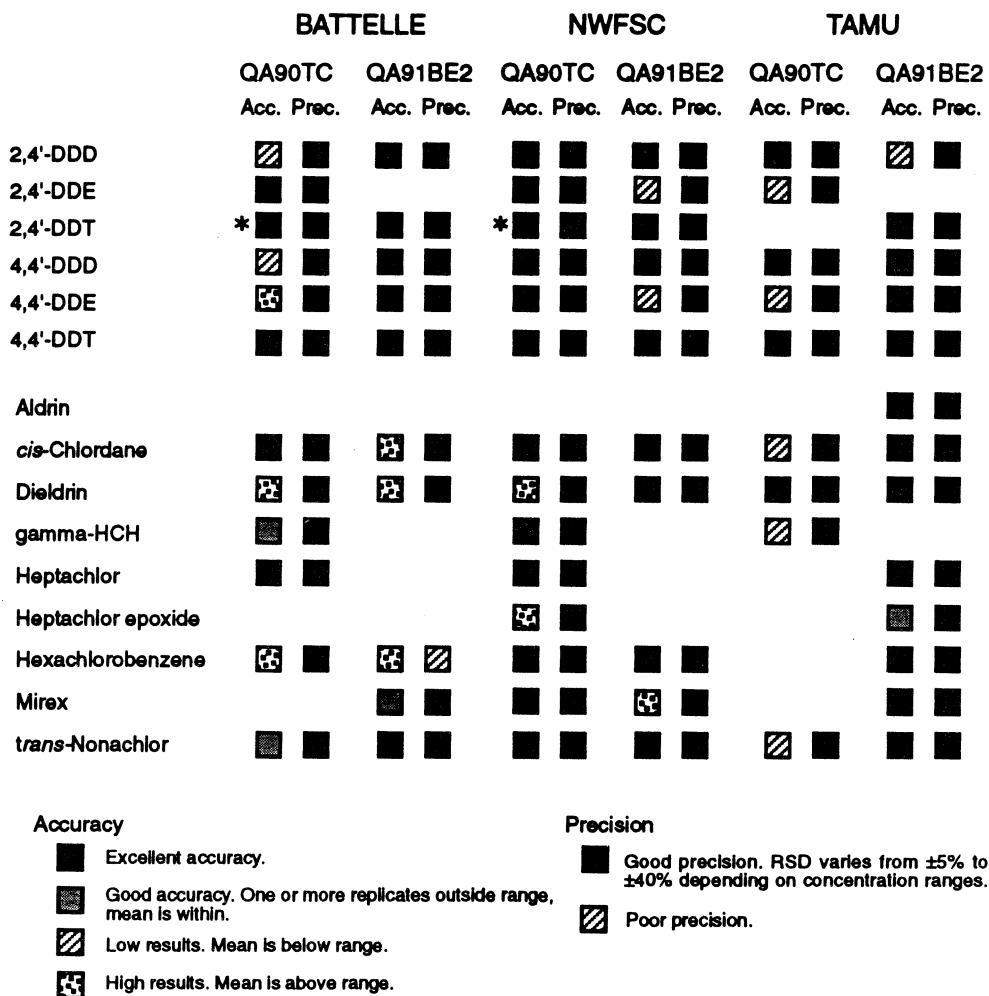

Figure 71. 1991 Chlorinated pesticides determination performance evaluation (* - Consensus value low and standard deviation high so lower limit of accepted concentration range is negative.).

limits of the analytical method used by that laboratory. Overall, the PAH analyses results were good. All results were within $\pm 35\%$ of the concentration range defined by plus or minus one standard deviation of the consensus value, except for the naphthalene results reported by NWFSC for the Bivalve Extract II (QA91BE2).

The results of the PCB congener analyses are shown in Figure 70. The consensus value calculated for PCB 206 for the Tissue Control Material III (QC90TC) was low and standard deviation high, so the lower limit of the accepted concentration range was negative. Several laboratories reported no values or values below the MDLs for several congeners. Many BATTELLE results were high for both materials in the 1991 exercise. The results reported by NWFSC were high for the Tissue Control Material III. Those reported by TAMU for the same material were low. All results were within $\pm 35\%$ of the NS&T concentration range defined by plus or minus one standard deviation of the consensus value, except for the PCB 66 results reported by NWFSC for the Tissue Control Material III (QC90TC).

The results of the chlorinated pesticide analyses are shown in Figure 71. The concentrations of these compounds in the exercise materials were low, and the lower limit of the concentration range defined by plus or minus one standard deviation was negative. The results reported by TAMU for 2,4'-DDD and gamma-HCH for the Tissue Control Material III, and for 2,4'-DDD for the Bivalve Extract II were outside the NS&T $\pm 35\%$ of the concentration range.

The overall precisions of the triplicate extraction analyses were very good.

5.2. 1992 Exercise

The 1992 trace organic intercomparison exercise was also organized by NIST. The materials used were prepared by NIST and were Marine Sediment III (QA92SED3) and Mussel Tissue IV Homogenate (QA92TIS4). The NS&T cooperating laboratories again were NWFSC, BATTELLE, and TAMU. Marine Sediment III was sent to 30 other laboratories and Mussel Tissue IV Homogenate to 29.

Results were received from 16 laboratories, in addition to the NS&T cooperating laboratories. A sediment was chosen for the exercise since none had been used since 1987. The results of the NS&T cooperating laboratories are listed in Appendix V.

5.2.1. Description of materials and exercise

Marine Sediment III was a wetted marine sediment prepared using candidate SRM 1941a and water (NIST, 1992 and 1993a). The material was issued wet to more closely match the matrix analyzed by the laboratories. This material was uncharacterized prior to its use for the 1992 exercise. NIST certified and noncertified values became available about a year later (NIST, 1994a). The sediment for candidate SRM 1941a was collected in the Chesapeake Bay near the Francis Scott Key Bridge using a modified Van Veen-type grab sampler with the assistance of NOAA. The sediment was stored in Teflon-lined containers at approximately 5°C until the material was freeze dried. The material was then sieved and the -60 to +100 (250 - 149 μm) mesh fraction was collected, blended, and radiation sterilized. The resulting material was homogenized and bottled, with the exception of the material needed for Marine Sediment III, which was stored in bulk in a Teflon-lined container. Exactly 8.00 g of the marine sediment were weighed into each glass bottle, and approximately 4 days before shipment of the sample to the various laboratories, 9.02 \pm 0.02 g of water were added to each tared bottle. The masses of sediment and of the water in each bottle were accurately recorded. Trials showed that 9 g of water could moisten 8 g of sediment and only a very small amount of water was

observed on top of the sediment sample. Each bottle of material was stored at -80°C until shipped in dry ice to participants.

The mussels used for the Mussel Tissue IV Homogenate (QA92TIS4) were collected at Dorchester Bay, MA, by NOAA personnel in conjunction with Battelle New England (NIST, 1993b and 1993c). The mussels were shucked and cryogenically homogenized and stored in a teflon bag in a liquid nitrogen freezer at NIST. Approximately 15-20 g (wet wt.) portions of the mussel homogenate were aliquoted into precooled bottles. All subsequent manipulations of the bottles were performed in the liquid nitrogen freezer to avoid warming of the samples. The bottles were stored at -80°C until shipment on dry ice via overnight delivery to the participating laboratories. As for the 1991 exercise, each laboratory received three ampoules or jars of each unknown, and were asked to extract the materials and perform triplicate injections from a sample from one of the ampoules or jars, and single injections from the other two. Two ampoules each of concentrated PCBs (SRM 2262), pesticides (SRM 2261), and PAHs (SRM 2260) calibration solutions were also sent to each participant analyzing the Marine Sediment III, and only of SRM 2262 to those analyzing the Mussel Tissue IV Homogenate. A computer diskette with appropriate files accompanied the samples to facilitate data reporting.

Several sets of coeluting or unresolved PAHs and PCBs were noted by NIST. These were: chrysene and triphenylene; benzo[*b*]fluoranthene, benzo[*j*]fluoranthene, and benzo[*k*]fluoranthene; dibenz[*a,h*]anthracene and dibenz[*a,c*]anthracene; PCB 66 and PCB 95; PCB 101 and PCB 90; PCB 138, PCB 163, and PCB 164; PCB 170 and PCB 190; and PCB 187 and PCB 182. Coelution and lack of resolution in chromatography are functions of gas chromatographic analytical conditions, such as column type and size, and oven temperatures. Some of these coeluting or unresolved analytes may also have occurred during analyses by the cooperating laboratories. Some matrix interferences were noted during the exercises.

5.2.2. Consensus values

Consensus values were calculated as described in Section 5.1.2.

5.2.3. Results

5.2.3.1. Marine Sediment III (QA92SED3)

The results of the Marine Sediment III (QA92SED3) intercomparison exercise are shown graphically in Figures 72 - 77. The results of analyses of the 2- and 3-ring PAHs (low molecular weight) and the 4- and 5-ring (high molecular weight) PAHs are shown graphically in Figures 72 and 73. The compounds in each of these classes of PAHs are listed in Table 13. As before, the dotted line is the range defined by plus or minus one standard deviation of the consensus value, and the dashed line is $\pm 35\%$ of the high and low limits of the consensus value range. With few exceptions, the results of all NS&T laboratories were within the specified range, and most were within the smaller range of plus or minus one standard deviation of the consensus value.

The results of the NS&T cooperating laboratories PCB congener determinations are shown in Figure 74. Several laboratories reported values below their MDLs. The results reported by BATTELLE for PCBs 8 and 118, by TAMU for PCB 128 and by NWFSC for PCB 170/190, were higher than the NS&T limit of acceptability. The rest of the results were mostly within plus or minus one standard deviation of the consensus value.

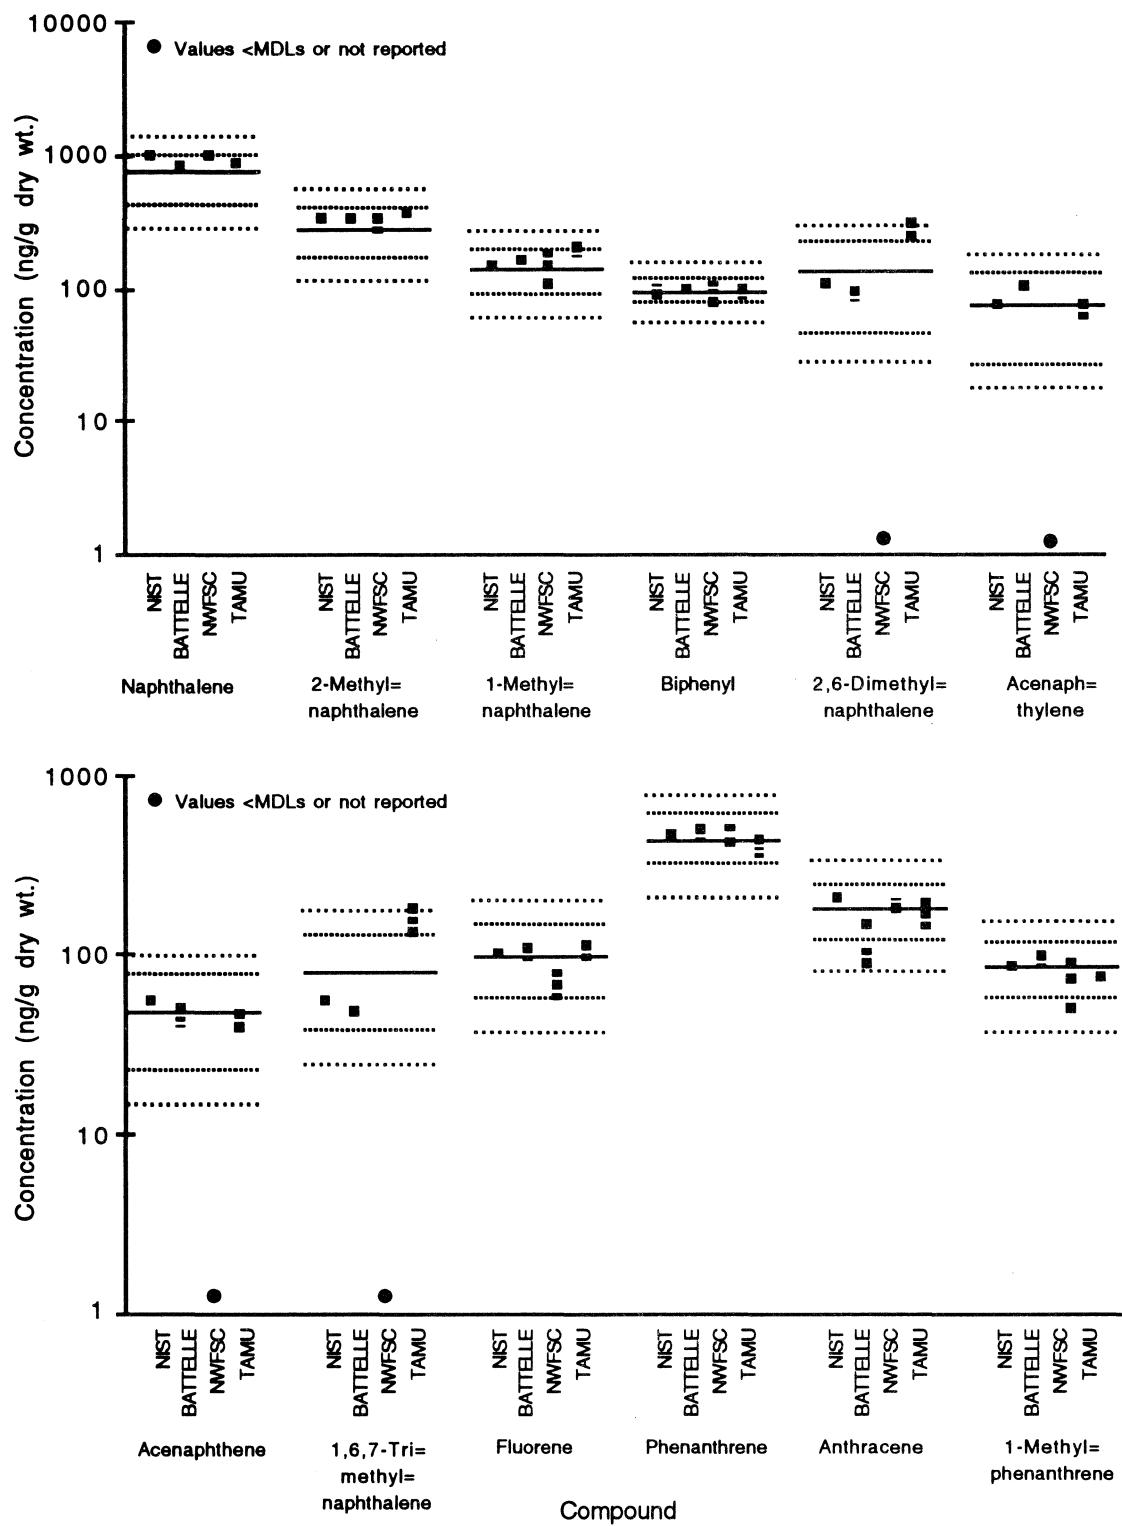

Figure 72. 1992 Marine Sediment III (QA92SED3) intercomparison exercise results of low molecular weight PAHs (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

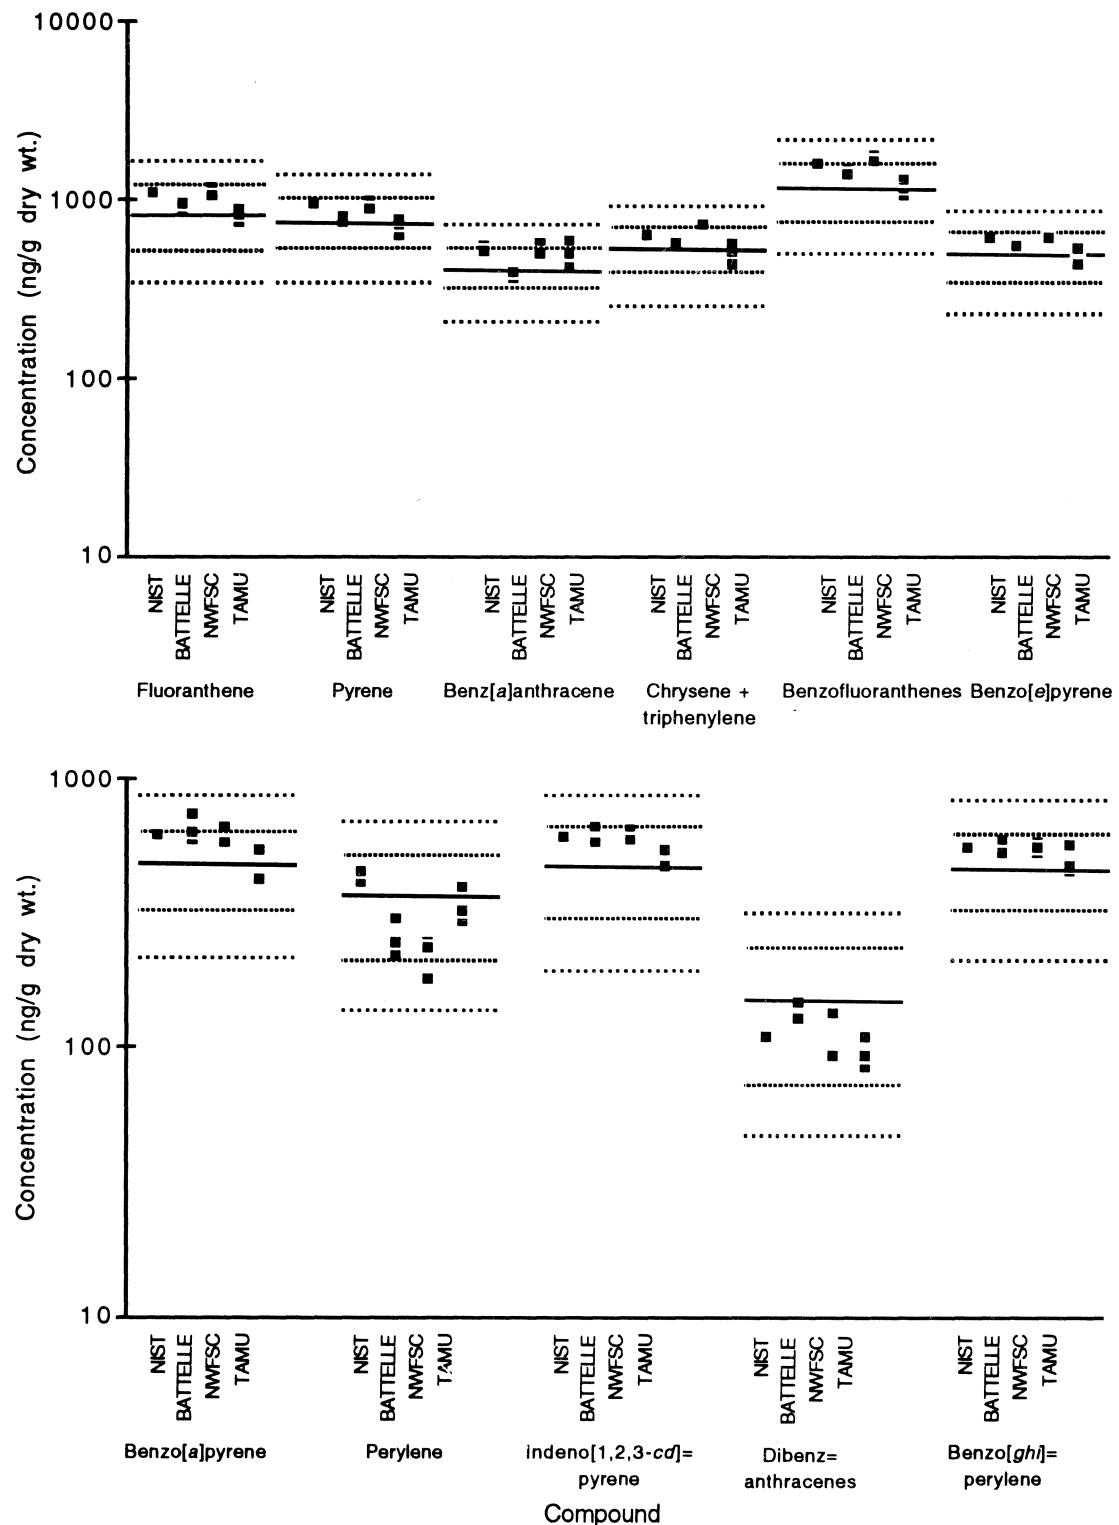

Figure 73. 1992 Marine Sediment III (QA92SED3) intercomparison exercise results of high molecular weight PAHs (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

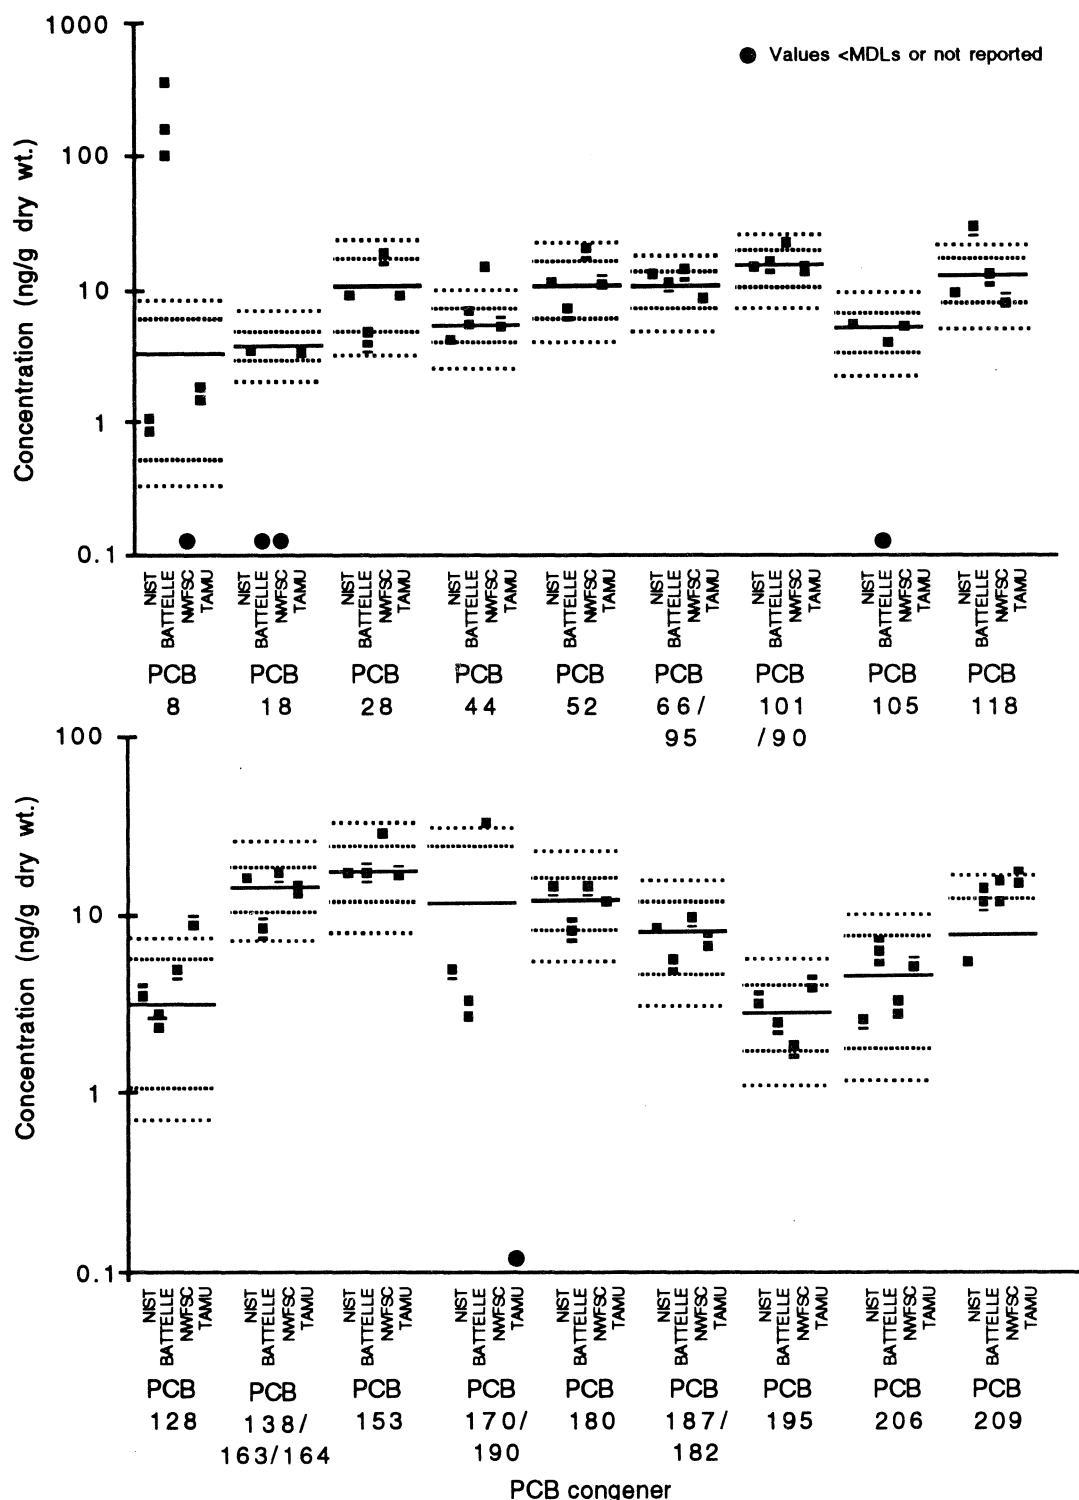

Figure 74. 1992 Marine Sediment III (QA92SED3) intercomparison exercise results of PCB congener analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted. Consensus values for PCB s170/90 and 209 were low and the standard deviation high so lower limit of acceptability ranges are negative.) (ng/g dry wt.).

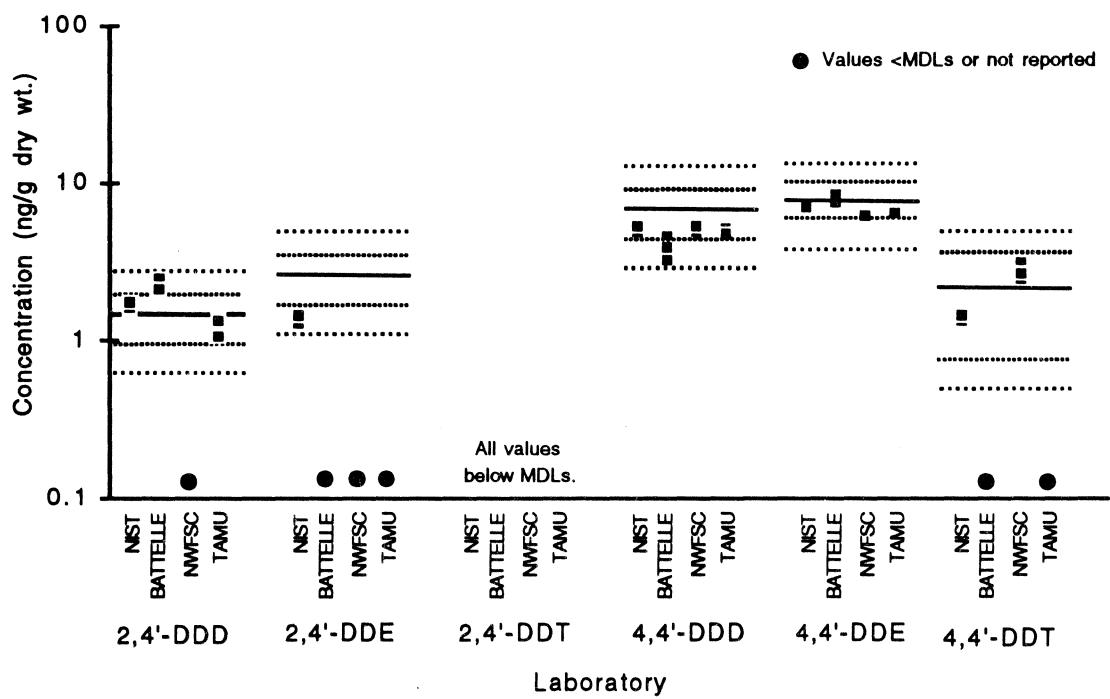

Figure 75. 1992 Marine Sediment III (QA92SED3) intercomparison exercise results of DDT and metabolite analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

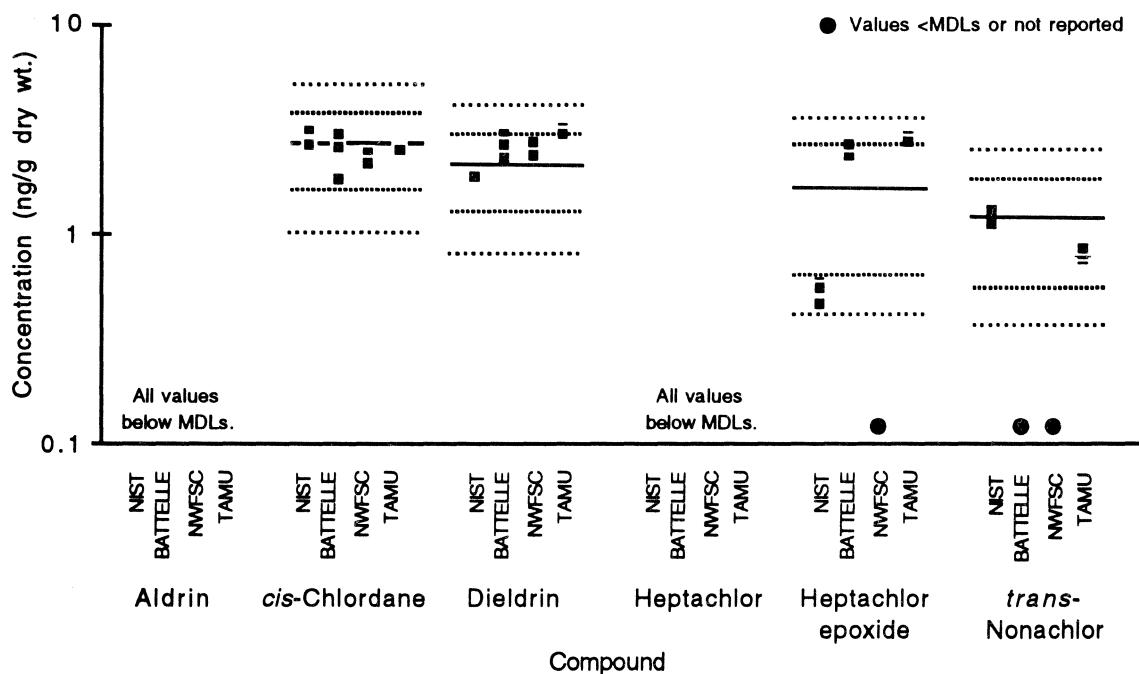

Figure 76. 1992 Marine Sediment III (QA92SED3) intercomparison exercise results of cyclopentadiene pesticide analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

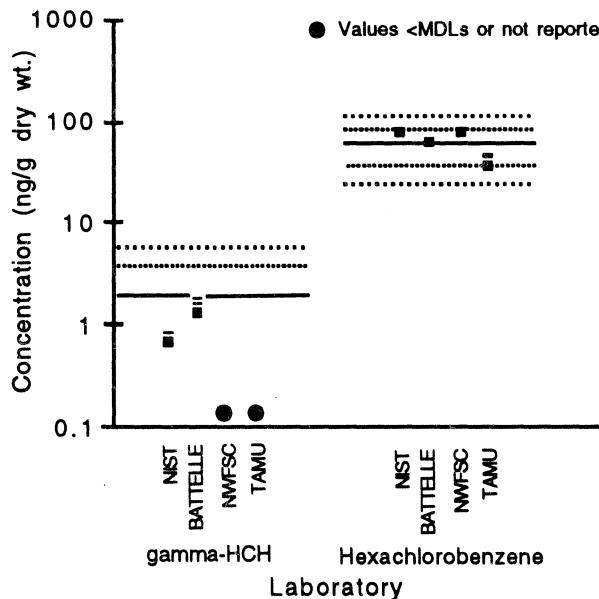

Figure 77. 1992 Marine Sediment III (QA92SED3) intercomparison exercise results of gamma-HCH and hexachlorobenzene analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted line is the range defined as plus or minus one standard deviation of the consensus value. The dashed line is $\pm 35\%$ of this range. Circles indicate values below the MDLs or not submitted.) (ng/g dry wt.).

The results for DDT and metabolites are shown in Figure 75. The levels of these compounds in the Marine Sediment III material were low and several laboratories reported values below their MDLs. Good results were obtained for 4,4'-DDD and 4,4'-DDE, except for a low mean reported by BATTELLE for 4,4'-DDD. The results reported by TAMU for 2,4'-DDD were within plus or minus one standard deviation of the consensus value. The mean reported by BATTELLE was high, and that reported for NWFSC below the MDL. The results of the analyses of the cyclopentadiene pesticides are shown in Figure 76. The results reported for *cis*-chlordane and dieldrin were good. All laboratories reported values below the MDLs for aldrin and heptachlor, and some also reported non-detectable concentrations for heptachlor epoxide and *trans*-nonachlor. Values below the MDLs were reported for gamma-HCH and no conclusions could be made (Figure 77). The values reported for hexachlorobenzene were good, although the TAMU results were slightly low. The results of the analyses of the DDT and metabolites and the chlorinated pesticides were difficult to judge since the levels of these compounds in the exercise material were low.

The ratios of the analytically determined mean values to those of the consensus values are shown in Figures 78 - 80 and these are indicative of bias. The order of the analytes is the same as that in Appendix V. The results for BATTELLE and NWFSC for the PAHs are mostly biased high (Figure 78). TAMU had little bias or error for the PAHs except for the results of 2,6-dimethylnaphthalene and 1,6,7-trimethylnaphthalene analyses. The ratios of the PCB analyses are shown in Figure 79. Most of the NWFSC results are biased high. The levels of chlorinated pesticides in the Marine Sediment III were very low and the participating laboratories reported values below the MDLs for many analytes (Figure 80). BATTELLE results appear to be biased high.

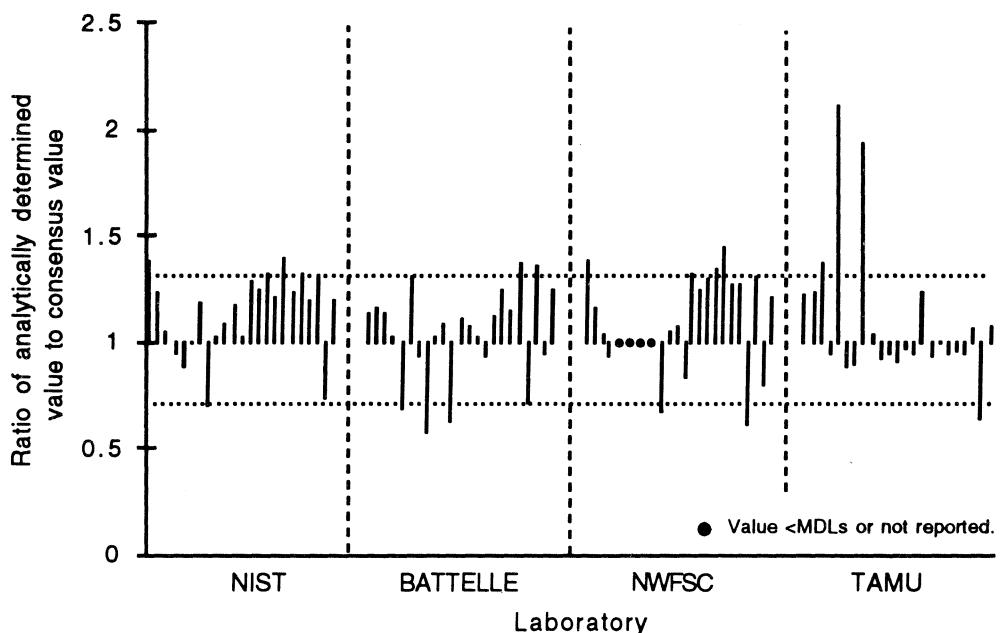

Figure 78. 1992 Marine Sediment III (QA92SED3) intercomparison exercise PAHs ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table V.1, Appendix V. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

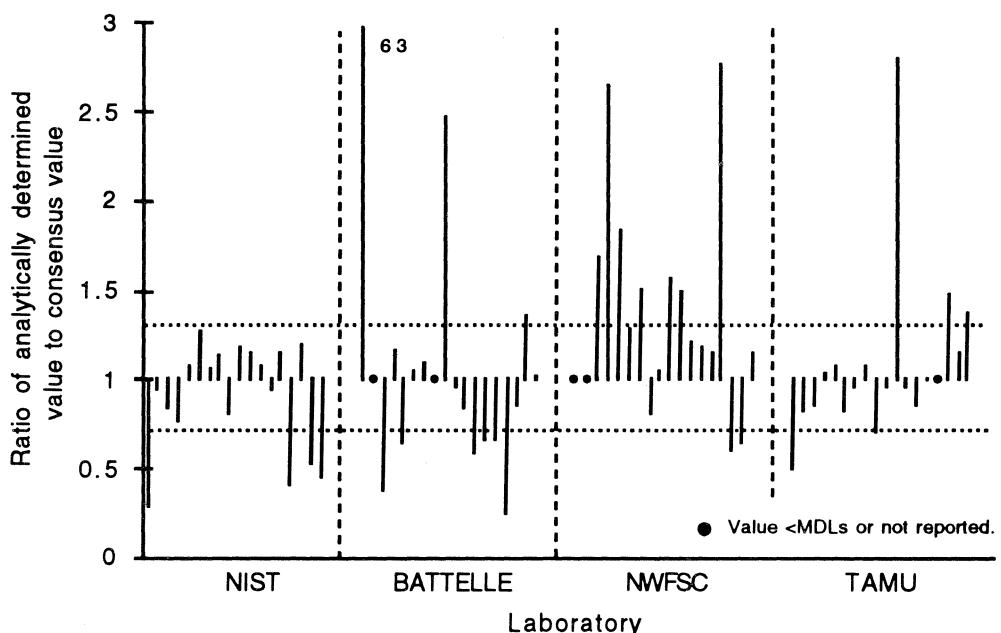

Figure 79. 1992 Marine Sediment III (QA92SED3) intercomparison exercise PCB congener ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table V.1, Appendix V. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

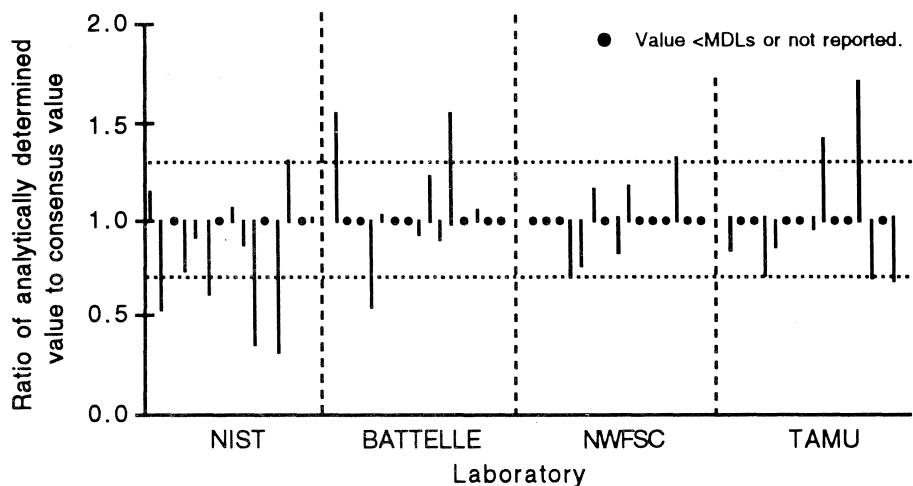

Figure 80. 1992 Marine Sediment III (QA92SED3) intercomparison exercise pesticides ratios of analytically determined mean value of three samples to consensus value (Order of analytes same as in Table V.1, Appendix V. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

5.2.3.2. Mussel Tissue IV Homogenate (QA92TIS4)

The results of the Mussel Tissue IV Homogenate (QA92TIS4) are shown in Figures 81 to 86. The results of analyses of the 2- and 3-ring PAHs (low molecular weight) and the 4- and 5-ring (high molecular weight) PAHs are shown graphically in Figures 81 and 82. As for previous exercises, the PAH results are mostly within the range defined as plus or minus one standard deviation of the consensus value. Larger variations in performance were observed for the PCB analyses (Figure 83). The results submitted by NWFSC were consistently high. NWFSC later determined that the high results were a result of a problem with the standard used to calculate the concentrations. The overall precision and accuracy decreased for PCBs 170/190, 180, 195, and 209, that are present in low concentrations in this material. The results for DDT and metabolites are shown in Figure 84. The standard deviations of the NIST-calculated consensus values were high for this material. With the exception of the TAMU result for 2,4'-DDD, all mean results were within the range defined as plus or minus one standard deviation of the consensus value. The same observation generally applies for the cyclopentadiene pesticides (Figure 85). TAMU reported low results for *cis*-chlordane, and BATTELLE high results for dieldrin. The consensus values calculated for heptachlor and heptachlor epoxide were low and standard deviations high, so the lower limits of the accepted concentration ranges are negative. The results for three other low-level chlorinated pesticides are shown in Figure 86. The levels of gamma-HCH and hexachlorobenzene were very low and the standard deviations of the consensus values high. The means of the results for mirex were within the range defined as plus or minus one standard deviation of the consensus value.

The ratios of the analytically determined mean values to those of the consensus values were again used as indicators of bias and are shown in Figures 87 - 89. NWFSC results are mostly low. No other clear bias could be observed in the PAH analyses results (Figure 87). The results submitted by NWFSC for PCBs were biased high (Figure 88). No clear bias trends could be determined for the other PCB analyses or for the chlorinated pesticides except for the TAMU results for pesticides which are mostly low (Figure 89).

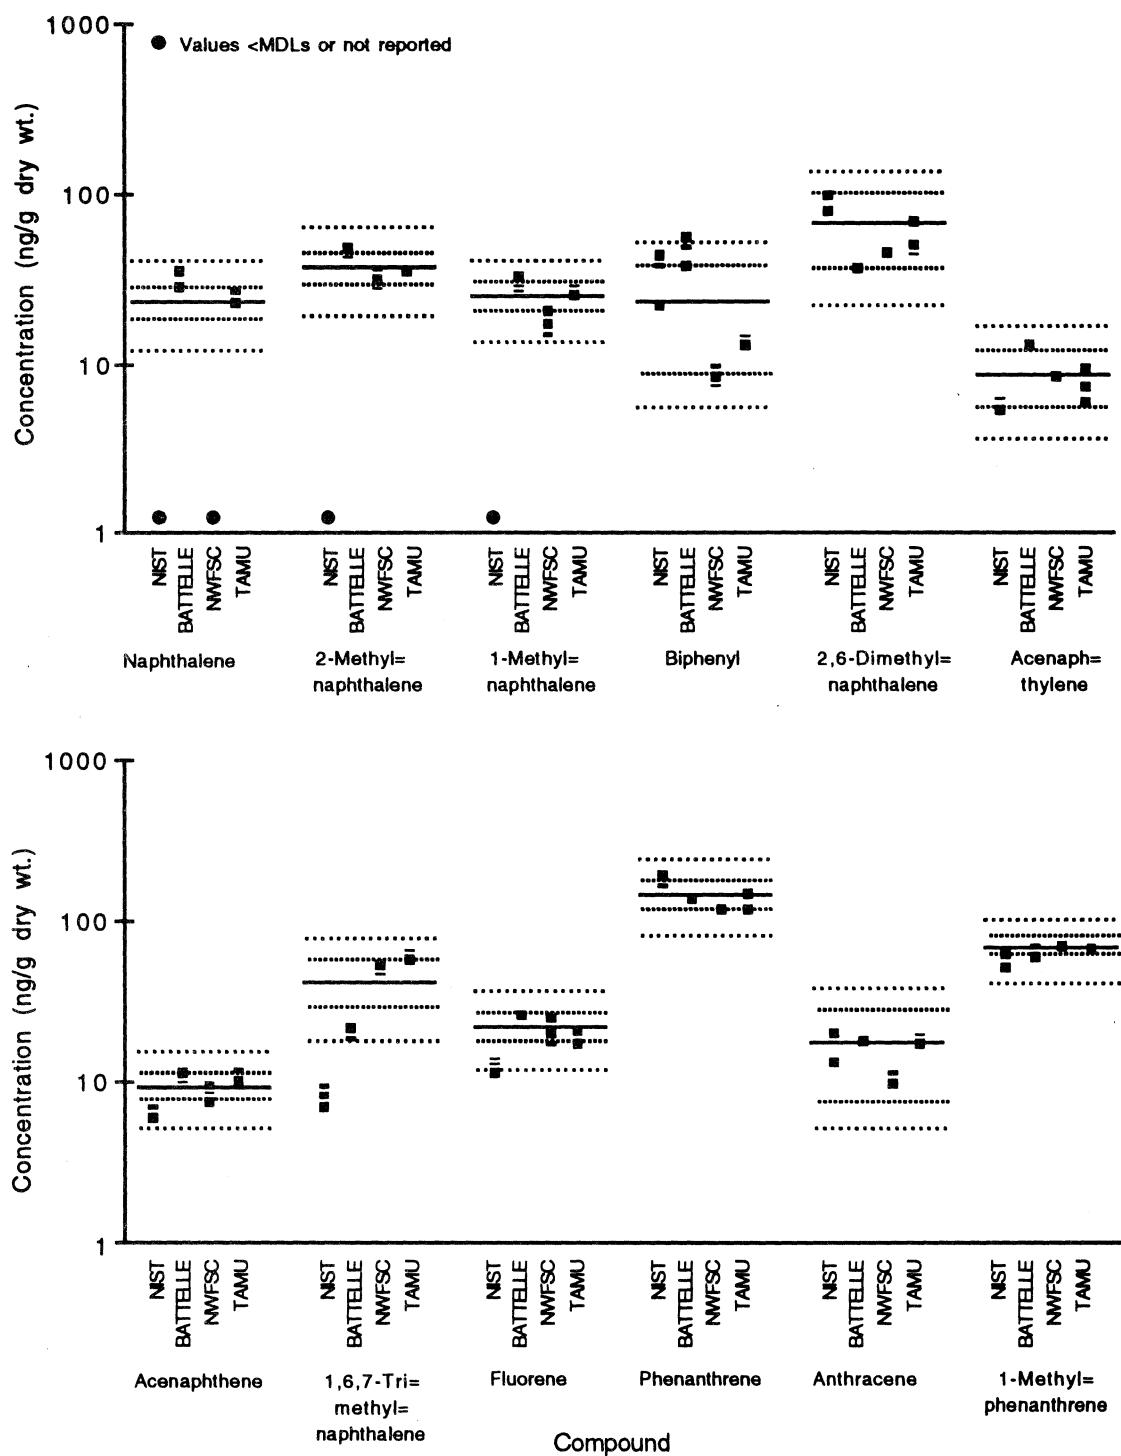

Figure 81. 1992 Mussel Tissue IV (QA92TIS4) intercomparison exercise results of low molecular weight PAHs (Solid line is the consensus value calculated by NIST using exercise results. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

5.2.4. Performance evaluation of NS&T laboratories

The accuracy and precision scale described in Section 4.1.4 was used to evaluate the performance of the NS&T cooperating laboratories in the 1992 exercise. The results of this evaluation is shown in Table 18. The same results are shown graphically in Figure 90 - 92. This graphical presentation does not take into account the concentration of the analyte in the exercise materials when compared to the MDLs of the participating laboratories. Typically, as the analyte concentration approaches the MDL of a method, the error increases. The accuracy of the PAH analyses were mixed with some results outside the accuracy criteria reported by all three laboratories (Figure 90). High results for the PCB congener determinations were reported by NMFSC for the Mussel Tissue IV (Figure 91). The evaluation of the results for the chlorinated pesticides is shown in Figure 92. As for previous exercises, when the analyte levels were low, the laboratories were unable to measure concentrations. The precision of the results was good.

5.3. 1993 Exercise

The 1993 trace organic intercomparison exercise was organized by NIST. The materials used were Mussel Tissue V (QA93TIS5) and Fish Homogenate I (QA93FSH1). The NS&T cooperating laboratories were NWFSC, BATTELLE, and TAMU as in previous years. Materials were sent to additional laboratories that participated on a voluntary basis. Mussel Tissue V samples were sent to 40 additional laboratories, 25 of which submitted results. Fish Homogenate I samples were sent to 41 additional laboratories, 22 of which submitted results. The results are listed in Appendix VI. In previous years, NIST participated in the intercomparison exercises primarily as a participant, reporting the results of analysis of three samples obtained using one analytical method. With the addition of a number of new laboratories to the QA Program and the use of natural, unspiked matrix materials, the determination of the accepted concentrations became more difficult. Therefore NIST analyzed the exercise materials using at least two methods

5.3.1. Description of materials and exercise

The Mussel Tissue V (QA93TIS5) was candidate SRM 1974a (NIST, 1994b). The material was prepared using mussels (*Mytilus edulis*) collected in Dorchester Bay, Boston, MA. The mussels were collected by hand during low tide, rinsed, stored in polyethylene bags, frozen, and shipped to NIST. The mussels were subsequently shucked, cryogenically homogenized, and blended following protocols of the NIST National Biomonitoring Specimen Bank. The blended, frozen material was stored in Teflon bags in a liquid nitrogen freezer prior to bottling. Portions of approximately 15 g (wet weight) of the mussel homogenate were aliquoted into pre-cooled cleaned and labeled bottles. All manipulation was done in the liquid nitrogen freezer to avoid warming of the homogenate or condensation in the frozen material. Approximately 400 bottles of the homogenate were labeled as Mussel Tissue V.

The Fish Homogenate I (QA93FSH1) was NRC candidate carp CRM and the first fish matrix to be used as part of the NS&T intercomparison exercises. Ampoules of the candidate carp CRM were purchased by NIST from NRC. The carp were harvested in Saginaw Bay, Lake Huron. The carp were comminuted and high-pressure homogenized. A small amount of water was added to raise the moisture content to 85%, and ethoxyquin (0.02%) was added to this slurry as an antioxidant. The material was dispensed into ampoules, sealed, and heated for a short time at 121°C to destroy the enzyme that promotes rancidity. Each ampoule contained approximately 9 g wet weight of the carp homogenate. The material was relabeled and shipped to the exercise participants.

Table 18. Laboratory performance evaluation for 1992 trace organic intercomparison exercise
(First letter is the evaluation of the accuracy and the second of the precision.).

Accuracy:	E	-	Excellent accuracy. All replicates are within the range defined by the consensus value calculated by NIST using exercise results plus or minus one standard deviation.
	G	-	Good accuracy. The mean of the replicates is within the range defined by the consensus value plus or minus one standard deviation, but one or more of the replicates is outside.
	L	-	Low results. The mean of the replicates is lower than the defined range.
	L-	-	Results lower than -30% of the lower limit of the defined range.
	H	-	High results. The mean of the replicates is larger than the defined range.
	H+	-	Results higher than +30% of the higher limit of the defined range.
Precision:	G	-	Good precision. The intralaboratory precision is within the following criteria for various analyte concentrations: Concentration \geq 50 ng/g, expected RSD \pm 10%; concentration \geq 20 - < 50 ng/g, expected RSD \pm 20%; and concentration < 20 ng/g, expected RSD \pm 40%.
	X	-	The intralaboratory precision is not within the criteria described above.
	-	-	No results or a "less than" value submitted.

Accuracy

- Excellent accuracy.
- Good accuracy. One or more replicates outside range, mean is within.
- Low results. Mean is below range.
- High results. Mean is above range.

Precision

- Good precision. RSD varies from $\pm 5\%$ to $\pm 40\%$ depending on concentration ranges.
- Poor precision.

Figure 91. 1992 PCB determination performance evaluation (* - Consensus value low and standard deviation high so lower limit of accepted concentration range is negative.).

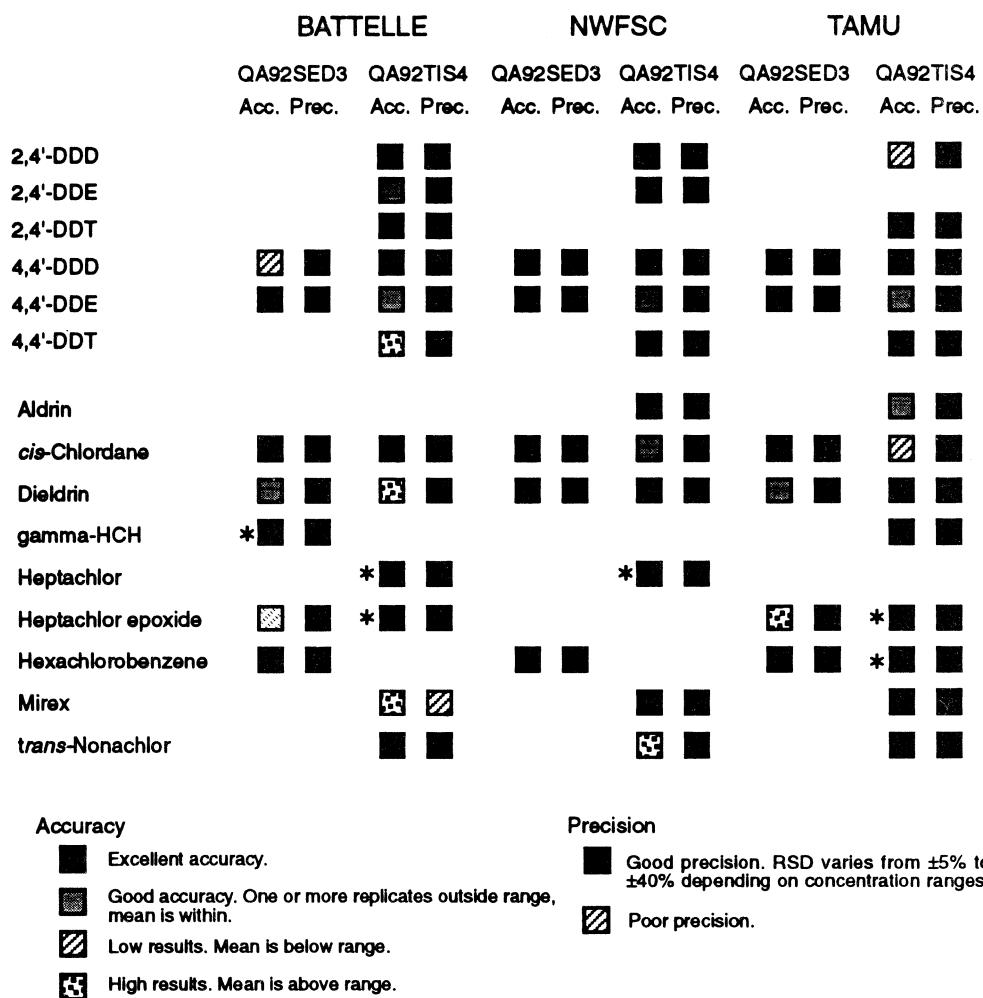

Figure 92. 1992 Chlorinated pesticides determination performance evaluation (No consensus values could be calculated for 2,2'-DDT, aldrin, heptachlor, or mirex.) (* - Consensus value low and standard deviation high so lower limit of accepted concentration range is negative.).

Each laboratory received three ampoules or jars of each unknown, and were asked to extract the materials and perform triplicate injections of the extract of one sample, and single injections of the other two. Two ampoules of concentrated PCB solution (candidate SRM 2262) were also sent to each participant. As for previous exercises, a computer diskette with appropriate files accompanied the samples to facilitate data reporting. The analytes determined are the organic compounds listed in Table 1.

5.3.2. Consensus values

The consensus values were calculated as described in Section 5.1.2. In addition, NIST analyzed the exercise materials using two different analytical methods in order to obtain reference values for comparison.

5.3.3. Results

5.3.3.1. Mussel Tissue V (QA93TIS5)

The results of determinations of the 2- and 3-ring PAHs (low molecular weight) and the 4- and 5-ring (high molecular weight) PAHs by the NS&T cooperating laboratories are shown graphically in Figures 93 and 94, respectively. The results of the laboratories were within the NS&T specified range, and most were within the smaller range defined as plus or minus one standard deviation of the consensus value. BATTELLE reported several concentrations as below the MDLs. The results of the PCB analyses are shown in Figure 95. All laboratories reported results for some PCB congeners that were higher than the consensus values plus or minus one standard deviation. The results submitted by BATTELLE for PCB 180 and by NWFSC for PCB 170/190 were higher than the NS&T limit of acceptability. The differences between the consensus values and the two reported means for these analytes were not very large and within reasonable analytical error for low concentration ranges. BATTELLE results were high for the low chlorination PCB congeners (PCBs 8 through PCB 105). The results for the DDT and metabolites analyses for the Mussel Tissue V are shown in Figure 96. The levels of some of these compounds were low and the accuracy and precision of the analyses were low. The levels of 4,4'-DDD and 4,4'-DDE were the highest of this group of analytes and the results for these were within the range defined by plus or minus one standard deviation of the consensus value. The levels of the cyclopentadiene pesticides were also low and one or more of the laboratories reported values below the MDLs for aldrin, heptachlor, and heptachlor epoxide (Figure 97). Except for the results submitted by NWFSC for *cis*-chlordane, the results submitted for *cis*-chlordane, dieldrin and *trans*-nonachlor were within acceptable limits. The levels of gamma-HCH, hexachlorobenzene and mirex were low and several values below the MDLs were reported by the laboratories (Figure 98). The means reported for these three compounds, however, were within the limits of acceptability.

The ratios of the analytically determined mean values to those of the consensus values are shown in Figure 99 - 101. The order of the analytes is the same as those in Appendix VI. BATTELLE results for the high molecular weight PAHs were biased high. TAMU results for the low molecular weight PAHs are biased high, and those for the high molecular weight PAHs low (Figure 99). No other pattern in the bias distribution could be found. The ratios for the PCB congeners are shown in Figure 100 and the results for BATTELLE and NWFSC are biased high. No obvious pattern could be found in the bias of the chlorinated pesticides (Figure 101).

Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

5.3.3.2. Fish Homogenate I (QA93FSH1)

The results of the intercomparison exercise are shown graphically in Figures 102 - 105. The levels of PAHs in fish flesh are extremely low due to metabolism of the compounds. Therefore, analysis of these compounds in the Fish Homogenate was not required. The concentrations of PCBs and pesticides for the Fish Homogenate I were reported on a wet weight basis, hence the PCB concentrations are 3 to 60 times higher than those found in the Mussel Tissue V material, and the pesticides are 3 to 15 times, and up to 100, higher in the Fish Homogenate than in the mussel material. The Mussel Tissue V concentrations were reported on a dry weight basis. Despite the difference in concentration, the relative percent standard deviation of the consensus means were similar for both materials.

The results for the analyses of PCBs are shown in Figure 102. The results submitted by BATTELLE are high for the low chlorination level congeners (PCB 8, 18, 28, 44, 52, 66/95, 101/90, and 105). Some of these results are above the NS&T limit of acceptability defined as $\pm 35\%$ of the high and low limits of the consensus value range. The means submitted by NWFSC for PCBs 206 and 209 were above the NS&T limit of acceptability. The results of the DDT and metabolites analyses are shown in Figure 103. The results reported by NWFSC and BATTELLE for 2,4'-DDD were good, although the BATTELLE results were slightly low. The TAMU results were below the NS&T limit of acceptability. The results for 4,4'-DDD and 4,4'-DDE were good for NWFSC and TAMU. The BATTELLE results were slightly high for 4,4'-DDD and outside the upper NS&T limit of acceptability for 4,4'-DDE. BATTELLE results for 2,4'-DDE were very high. The results of the cyclopentadiene compounds are shown in Figure 104. All three laboratories reported values below the MDLs for aldrin and heptachlor. The standard deviation of the consensus values of heptachlor epoxide and *trans*-nonachlor were high, so the lower limits of the accepted concentration range are negative. Overall, the results were good considering the analyte levels in the exercise material. The results of the analyses of gamma-HCH, hexachlorobenzene, and mirex are shown in Figure 105. The results were good.

The ratios of the analytically determined mean values to those of the consensus values were again used as indicators of bias and are shown in Figures 106 and 107. The BATTELLE results for the low chlorination level PCB congeners are biased high. The results reported by NWFSC for the high chlorination level PCBs are biased slightly high. No clear bias could be observed for the TAMU results. No clear biases could be discerned from the pesticide results exercise results (Figure 107).

5.3.4. Performance evaluation of NS&T laboratories

The accuracy and precision scale described in Section 4.1.4 was used to evaluate the performance of the NS&T cooperating laboratories in the 1993 exercise. The results of this evaluation are shown in Table 19. The same results are shown graphically in Figures 108 - 110. This graphical presentation does not take into account the concentration of the analytes in the exercise materials when compared to the MDLs of the participating laboratories. Typically, as the analyte concentration approaches the MDL of a method, the error increases. The results of the PAH analyses were mixed (Figure 108). BATTELLE reported many values below the MDLs and the accuracies of the results reported by the three laboratories were variable. This may be, in part, the result of low analyte concentrations in the exercise materials. Many of the BATTELLE PCB analyses results were high, some exceeding the NS&T limit of acceptability (Figure 109). The results for NWFSC were high for the Mussel Tissue V and good for the Fish Homogenate. The results for TAMU were good for both materials, but the precision could be improved. The evaluation of the results for the chlorinated pesticides is shown in Figure 110. The analyte levels in these materials were low and many laboratories were unable to measure concentrations. It is difficult to make an overall assessment. The results of the analyses of some analytes such as 2,4'-DDD, dieldrin, *trans*-nonachlor, *cis*-chlordane, and gamma-HCH were good.

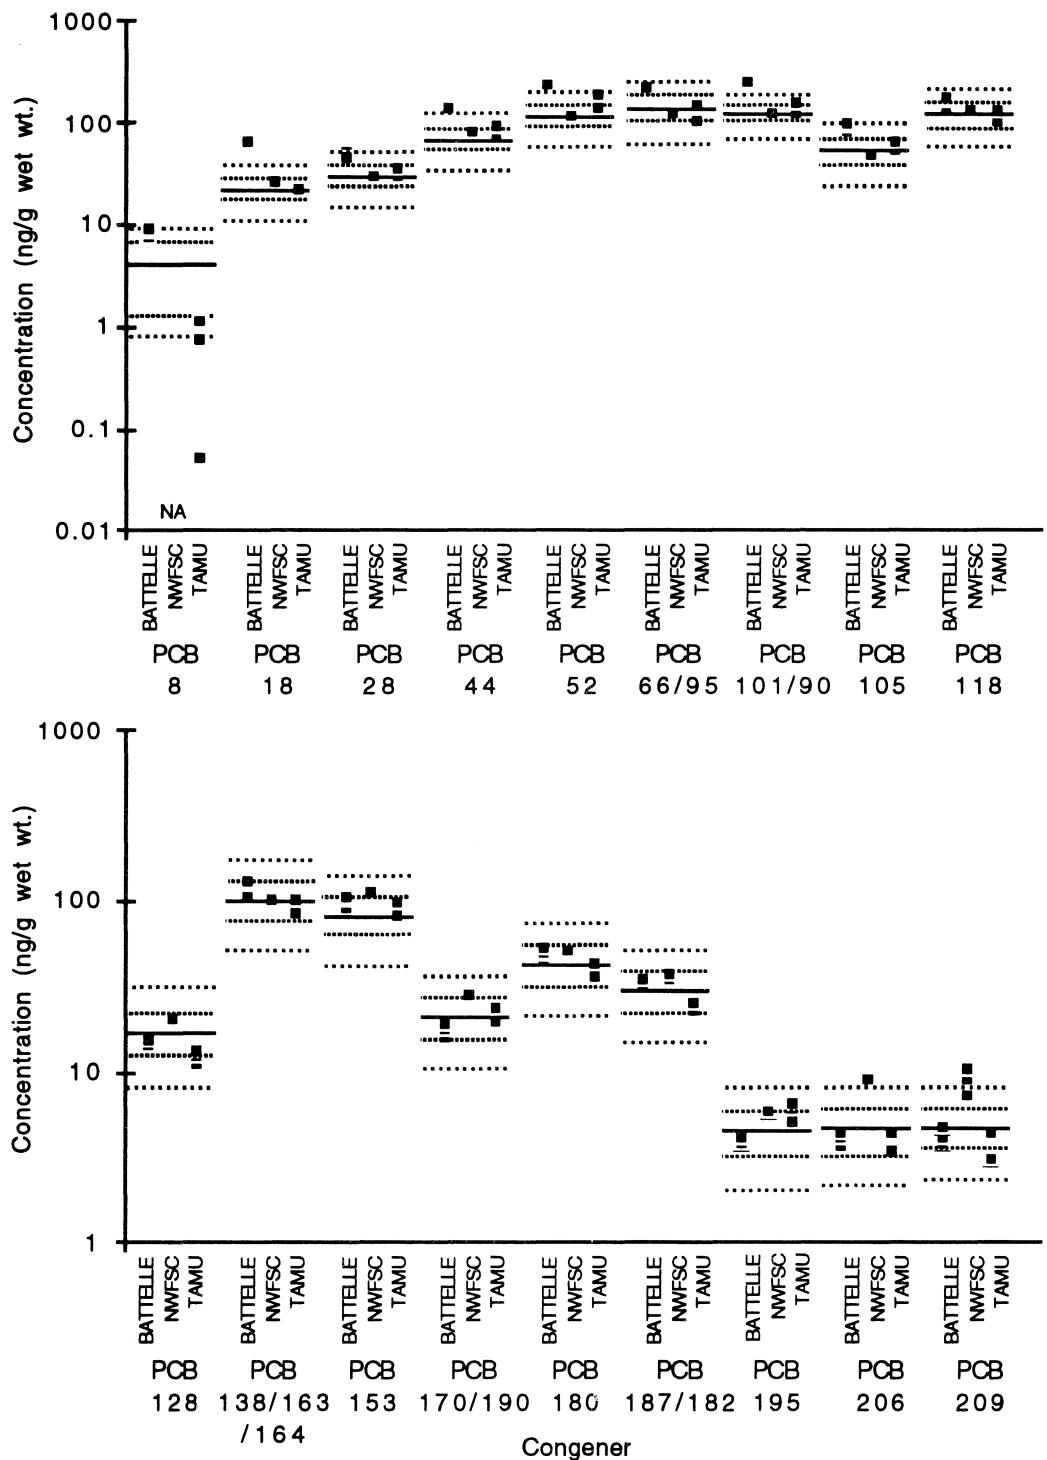

Figure 102. 1993 Fish Homogenate I (QA93FSH1) intercomparison exercise results of PCB congener analyses of three samples (Solid line is the consensus value calculated by NIST using exercise results. Dotted lines are $\pm 30\%$ of consensus value. Circles indicate values below the MDLs or not submitted.).

5.4. Overall evaluations

5.4.1. HORRAT values

Horwitz (1993) observed that similar relative standard deviation (RSD) values are obtained for similar analyte levels regardless of the nature of the analyte, matrix, or analytical method. The Horwitz equation resulting from that empirical observation is:

$$\text{RSD (predicted)} = 2^{(1 - 0.5 \log C)} = 2C^{-0.1505}$$

where C is the concentration expressed as a decimal fraction. The HORRAT value is the ratio of the observed versus the predicted RSD,

$$\text{HORRAT} = \frac{\text{RSD}_R (\text{observed})}{\text{RSD} (\text{predicted})}.$$

An analytical procedure can be considered acceptable if the HORRAT values are less than 2. This criteria has been adopted by the International Union of Pure and Applied Chemistry (IUPAC) and is found in the harmonized protocol for the adoption of standardized analytical methods. This is considered as acceptable precision of method performance among laboratories. Within-laboratory precision is often one-half to two-thirds of these values.

To evaluate the precisions achieved by the NS&T cooperating laboratories, the predicted RSD's were calculated for the results submitted by BATTELLE, NWFSC, and TAMU for PAHs, PCBs, and chlorinated pesticides in Mussel Tissue IV (QA92TIS4) and compared to the observed RSDs. Several of the other exercise materials contained very low levels of the analytes of interest resulting in many results below the MDLs of the laboratories so these results could not be used

(Predicted RSD_R were calculated using the Horwitz equation. Values below MDLs were removed from the data set prior to calculations.).

in these calculations. In most instances, the NS&T observed RSD were lower than the predicted RSD (Figure 111).

5.4.2. z scores

z scores can be used as an assessment of accuracy and are calculated using the formula,

$$z = \frac{(x - \bar{x})}{s}$$

where x is a laboratory concentration, \bar{x} is the consensus mean concentration, and s is the target standard deviation. For well-behaved analytical systems, the z scores are normally distributed with a mean of zero, and the z scores will be outside $|z| \leq 2$ in about 5% of the cases and outside $|z| \leq 3$ only in about 0.3%. When s is defined as $0.25 \bar{x}$, z scores, with due caution, can be used to compare results among analytes, test materials, and methods. When the target standard deviation is set to $0.25 \bar{x}$, the International Organization for Standardization (ISO) (1993) guidelines suggest that z scores can be classified as follows:

$ z \leq 2$	Satisfactory
$2 < z < 3$	Questionable
$ z \geq 3$	Unsatisfactory

z scores were calculated for two of the exercises using the standard deviation of the consensus value and $0.25 \bar{X}$ as the target s 's. The latter z scores are noted as 25% z scores in Appendix V and VI. When using $0.25 \bar{X}$ as the target s , the laboratory mean is $\leq 50\%$ from the assigned value when $|z| \leq 2$ (ISO, 1993). The laboratory mean is $\leq 75\%$ from the assigned value when $|z| > 3$. The 25% z scores calculated were for all possible cases and are listed in the Appendices. No z scores were analyzed for values reported as below the MDL.

An example of the distribution of the 25% z scores is shown in Figure 112 using the 1992 Mussel Tissue IV (QA92TIS4) exercise results for all analytes. Values $|z| > 3$ are not shown in the figure. Values $|z| \leq 2$ are considered satisfactory. BATTELLE z scores were mostly within the acceptable range, only 7 results are outside. There were many z scores for NWFSC above 2, indicating high results. There were 6 TAMU z scores less than -2, and two above three. The observations of the z scores distribution are similar to those of the ratios of the analytically determined values to the consensus values (Figures 87 - 89).

The ISO classification and summary of z scores for the trace inorganic and organic intercomparison exercises are summarized in Tables 20 and 21. All the z scores for the inorganic intercomparison exercises were in the acceptable range, except for the results of BATTELLE for Fish Q. More than 80% of the z scores of the trace organic intercomparison exercises for all three laboratories were within the satisfactory range (Table 21). The percentages of the z scores that were within the satisfactory range for the NWFSC results for the Tissue Control Material III (QCTC90) and for the Mussel Tissue IV Homogenate (QA92TIS4) were 74% and 69%, respectively. Considering the difficulties in analyses, it is encouraging that most results were in the satisfactory range.

6. CONCLUSIONS

The NS&T QA Project is an essential part of the NS&T Program as it ensures data quality, documents the performance of the laboratories and ensures a continued high level of performance. The level of analytical performance for the trace metal intercomparison exercises is good, although problems are still encountered in the analyses of some elements. There are still problems in the analyses of some organic compounds. Some of these problems are related to analytical limitations, such as coelution of compounds and others to the low levels of analytes present in the exercise materials. Overall, the performance of the NS&T cooperating laboratories continues to be acceptable as evidenced by the results of these exercises.

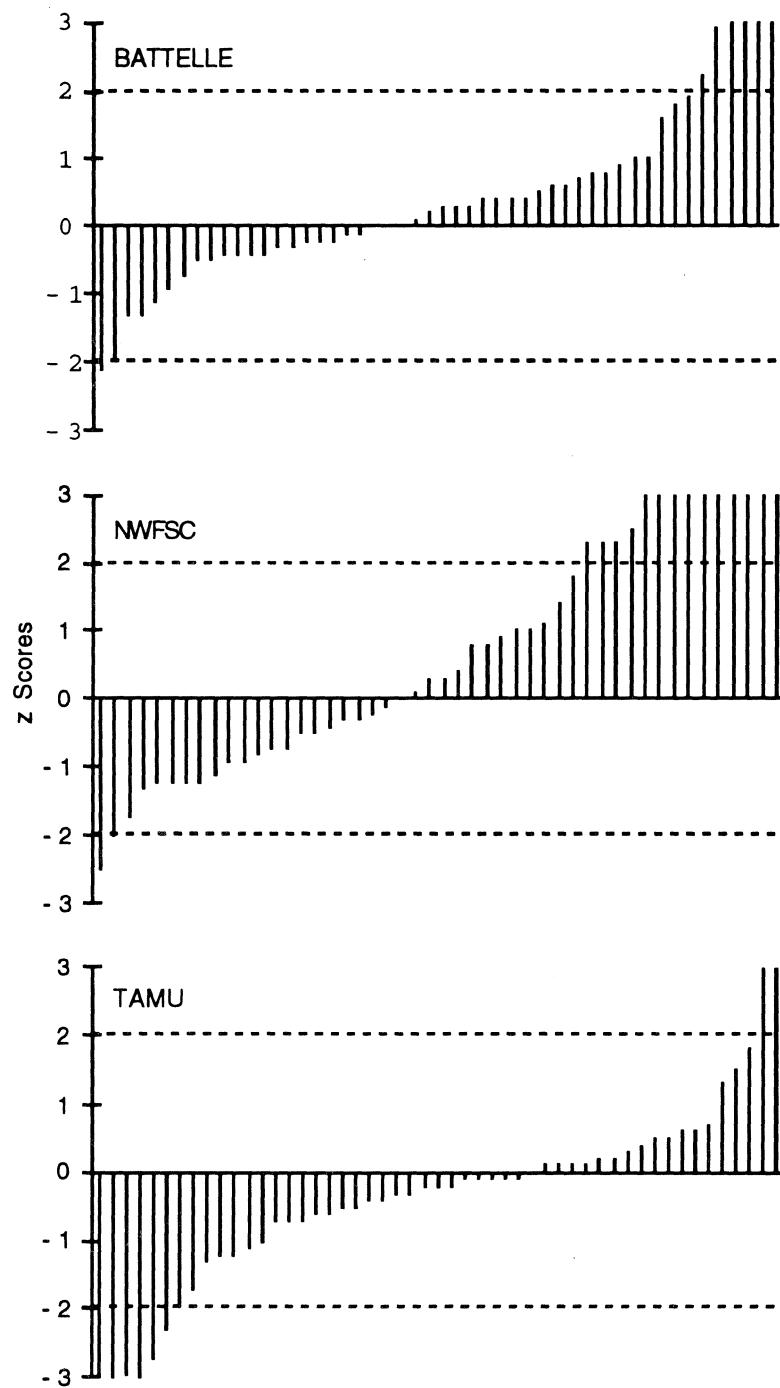

Figure 112. z Scores (25%) calculated for Mussel IV (QA92TIS4) intercomparison exercise results of all analytes above the MDL (z Scores higher than 3 or lower than -3 not shown. Z Scores were sorted by increasing value.).

8. ACKNOWLEDGEMENTS

The author wishes to thank S. Berman, S. Willie and R. Parris for the efforts in coordinating the exercises, processing the data and assisting the participants during these series of intercomparisons. The author also wishes to thank D. Brown, E. Crecelius, P. Hanson, P. Krahn, G. Lauenstein, C. Peven, B. Presley, M. Schantz, C. Sloan, W. Steinhauer, T. Wade, the many chemists and staff involved in the analyses of NS&T samples, and D. Harris, who assisted in the preparation and proof reading of this document.

APPENDIX I

1991 TRACE METAL INTERCOMPARISON EXERCISE RESULTS

NRC: National Research Council of Canada
BATTELLE: Battelle Ocean Sciences
SEFSC: NOAA/NMFS/Southeast Fisheries Science Center
TAMU: Texas A&M University/GERG

Cases in which outliers were identified using the Q test for outliers and, when warranted, were omitted from the mean, are noted with an apostrophe (').

Means that are outliers from the accepted or certified value are indicated with an asterisk (*).

S1, S2, S3, S4, S5: Results from five independent sample preparations and analyses.

S1-5 Mean: Mean of the five replicates.

SD: Standard deviation.

%RSD: Percent relative standard deviation.

Accepted value: Certified value or NRC-calculated consensus value for exercise material and uncertainty..

z Score: The ratio of a bias estimate to a performance criterion. The difference between the laboratory mean and the accepted mean was used as the bias estimate. z Scores were calculated in two ways, using the SD of the S1-5 mean, and 25% of the accepted value as performance criteria.

N R : Not reported.

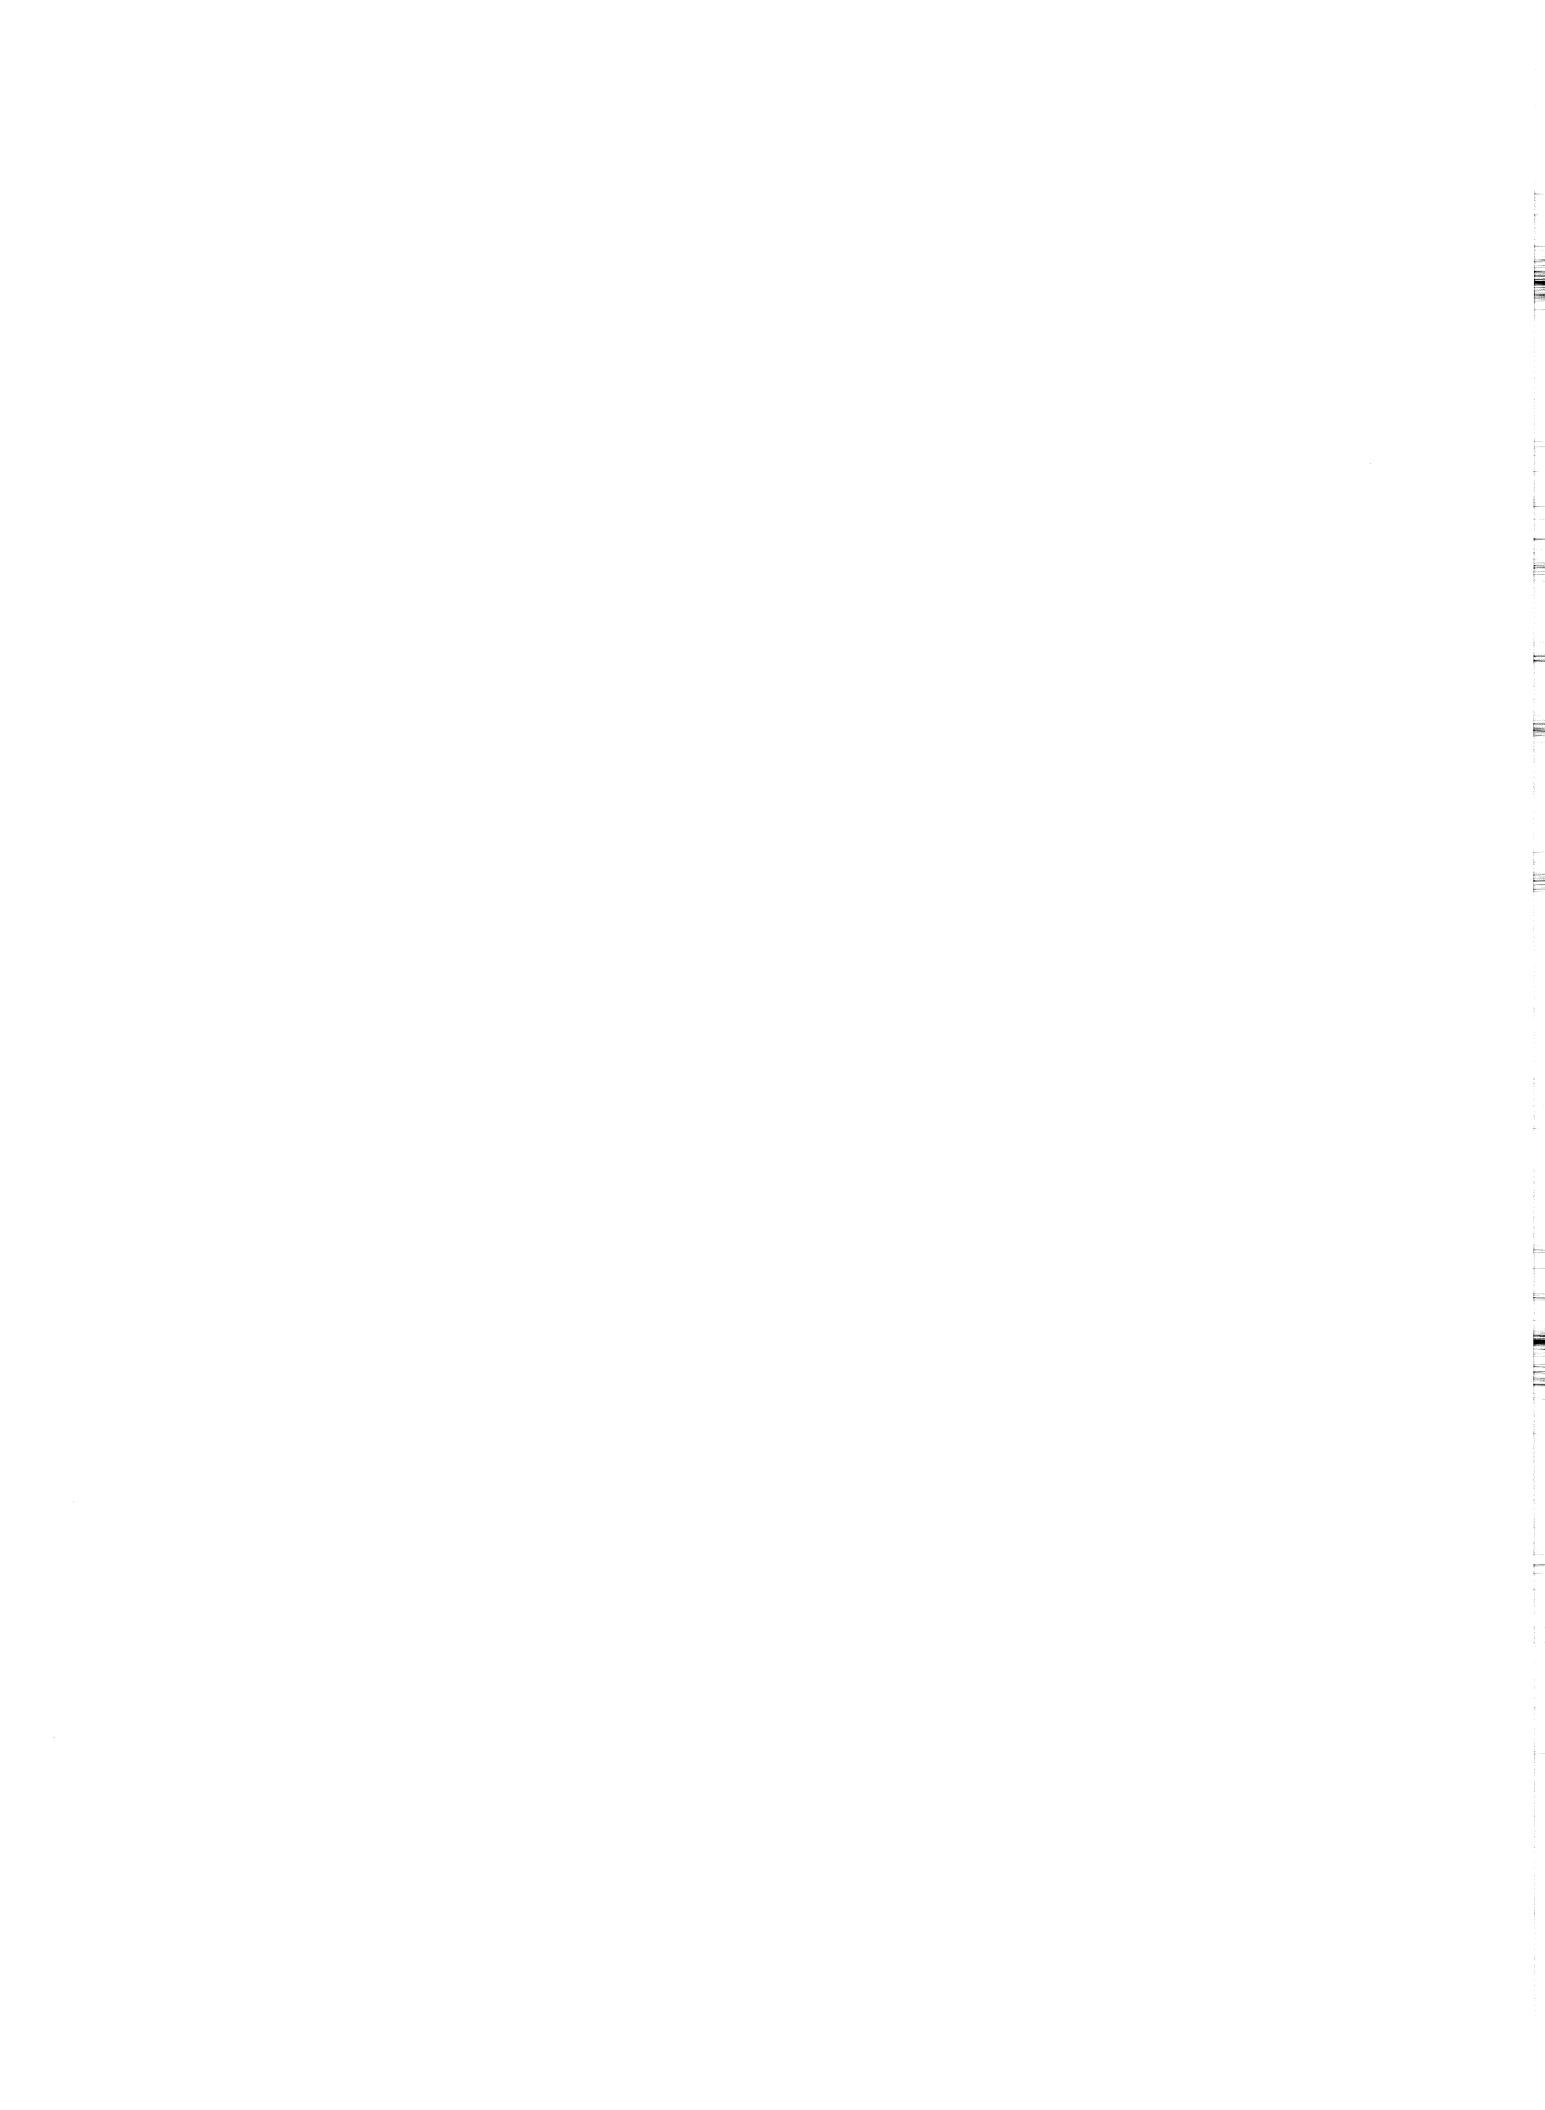

Table I.1. 1991 NOAA/5 Sediment N composition and intercomparison exercise results ($\mu\text{g/g}$ dry weight unless noted) (Ag not required.).

APPENDIX II

1992 TRACE METAL INTERCOMPARISON EXERCISE RESULTS

NRC: National Research Council of Canada
BATTELLE: Battelle Ocean Sciences
SEFSC: NOAA/NMFS/Southeast Fisheries Science Center
TAMU: Texas A&M University/GERG

Cases in which outliers were identified using the Q test for outliers and, when warranted, were omitted from the mean, are noted with an apostrophe (').

Means that are outliers from the accepted or certified value are indicated with an asterisk (*).

S1, S2, S3, S4, S5: Results from five independent sample preparations and analyses.

Mean: Mean of the five replicates.

SD: Standard deviation.

%RSD: Percent relative standard deviation.

Accepted value: Certified value or NRC-calculated consensus value for exercise material.

z Score: The ratio of a bias estimate to a performance criterion. The difference between the laboratory mean and the accepted mean was used as the bias estimate. z Scores were calculated in two ways, using the SD of the S1-5 mean, and 25% of the accepted value as performance criteria.

N R : Not reported.

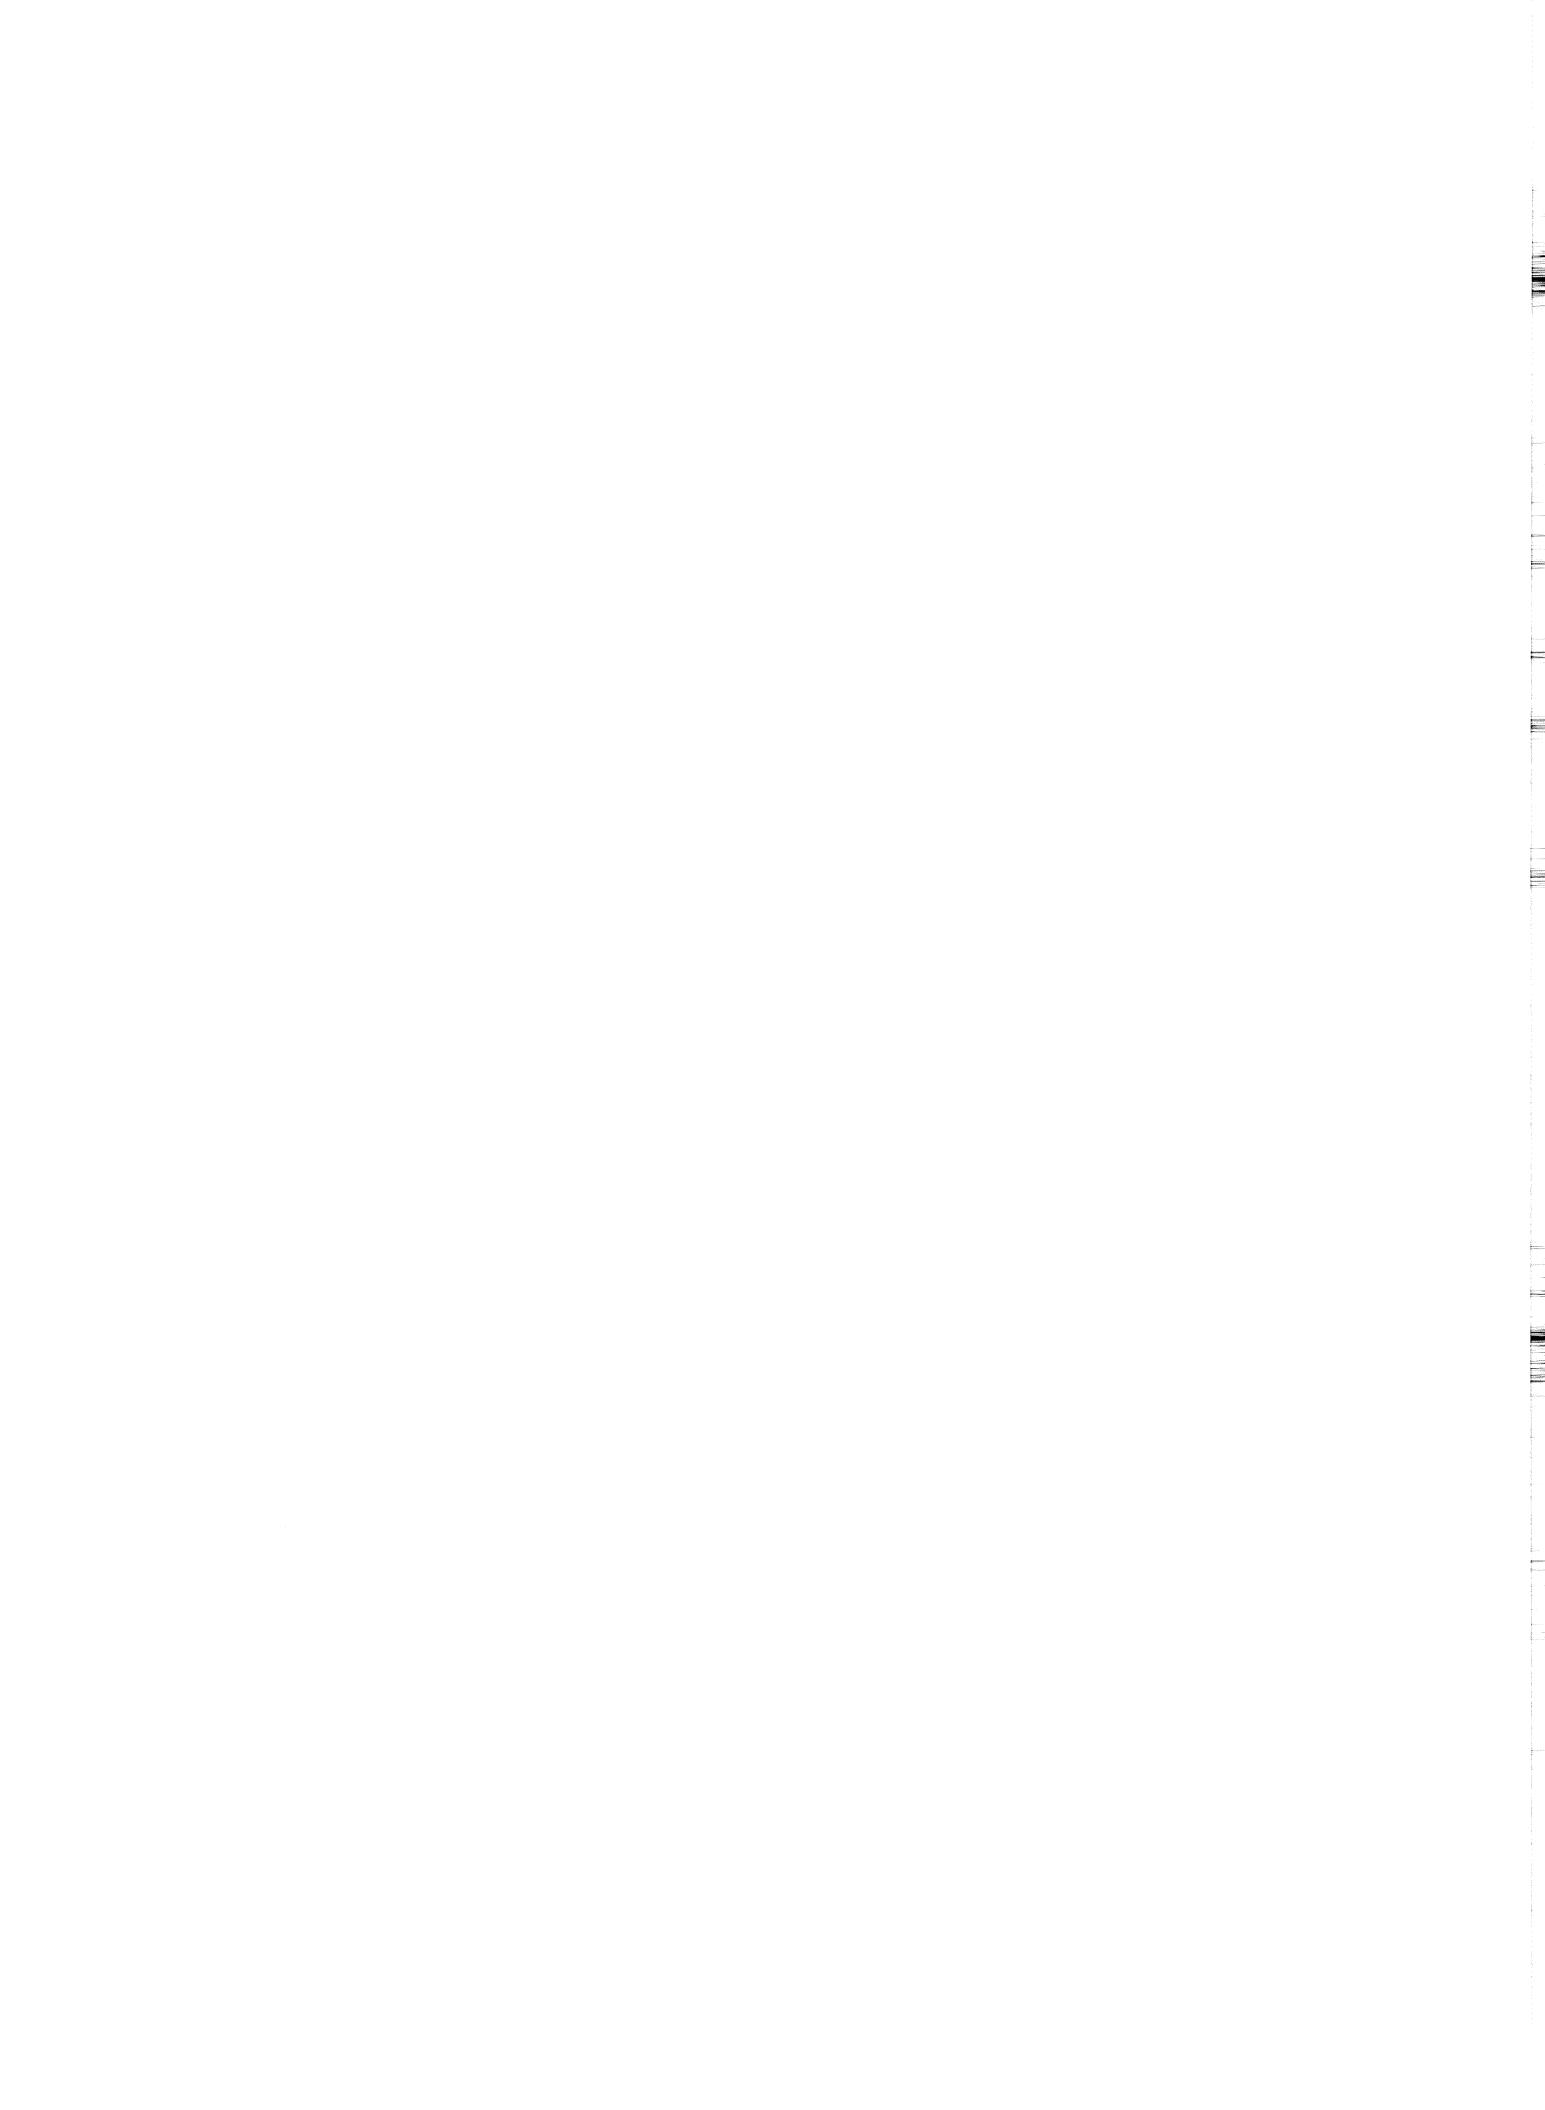

Table II.1. 1992 NOAA/6 Fish Q composition and intercomparison exercise results (μg/g dry weight unless noted) (Si, Mn, Sb, and Ti analysis not required.).

APPENDIX III

1993 TRACE METAL INTERCOMPARISON EXERCISE RESULTS

NRC: National Research Council of Canada
BATTELLE: Battelle Ocean Sciences
SEFSC: NOAA/NMFS/Southeast Fisheries Science Center
TAMU: Texas A&M University/GERG

Cases in which outliers were identified using the Q test for outliers and, when warranted, were omitted from the mean, are noted with an apostrophe (').

Means that are outliers from the accepted or certified value are indicated with an asterisk (*).

S1, S2, S3, S4, S5: Results from five independent sample preparations and analyses.

Mean: Mean of the five replicates.

SD: Standard deviation.

%RSD: Percent relative standard deviation.

Accepted value: Certified value or NRC-calculated consensus value for exercise material.

z Score: The ratio of a bias estimate to a performance criterion. The difference between the laboratory mean and the accepted mean was used as the bias estimate. z Scores were calculated in two ways, using the SD of the S1-5 mean, and 25% of the accepted value as performance criteria.

N R : Not reported.

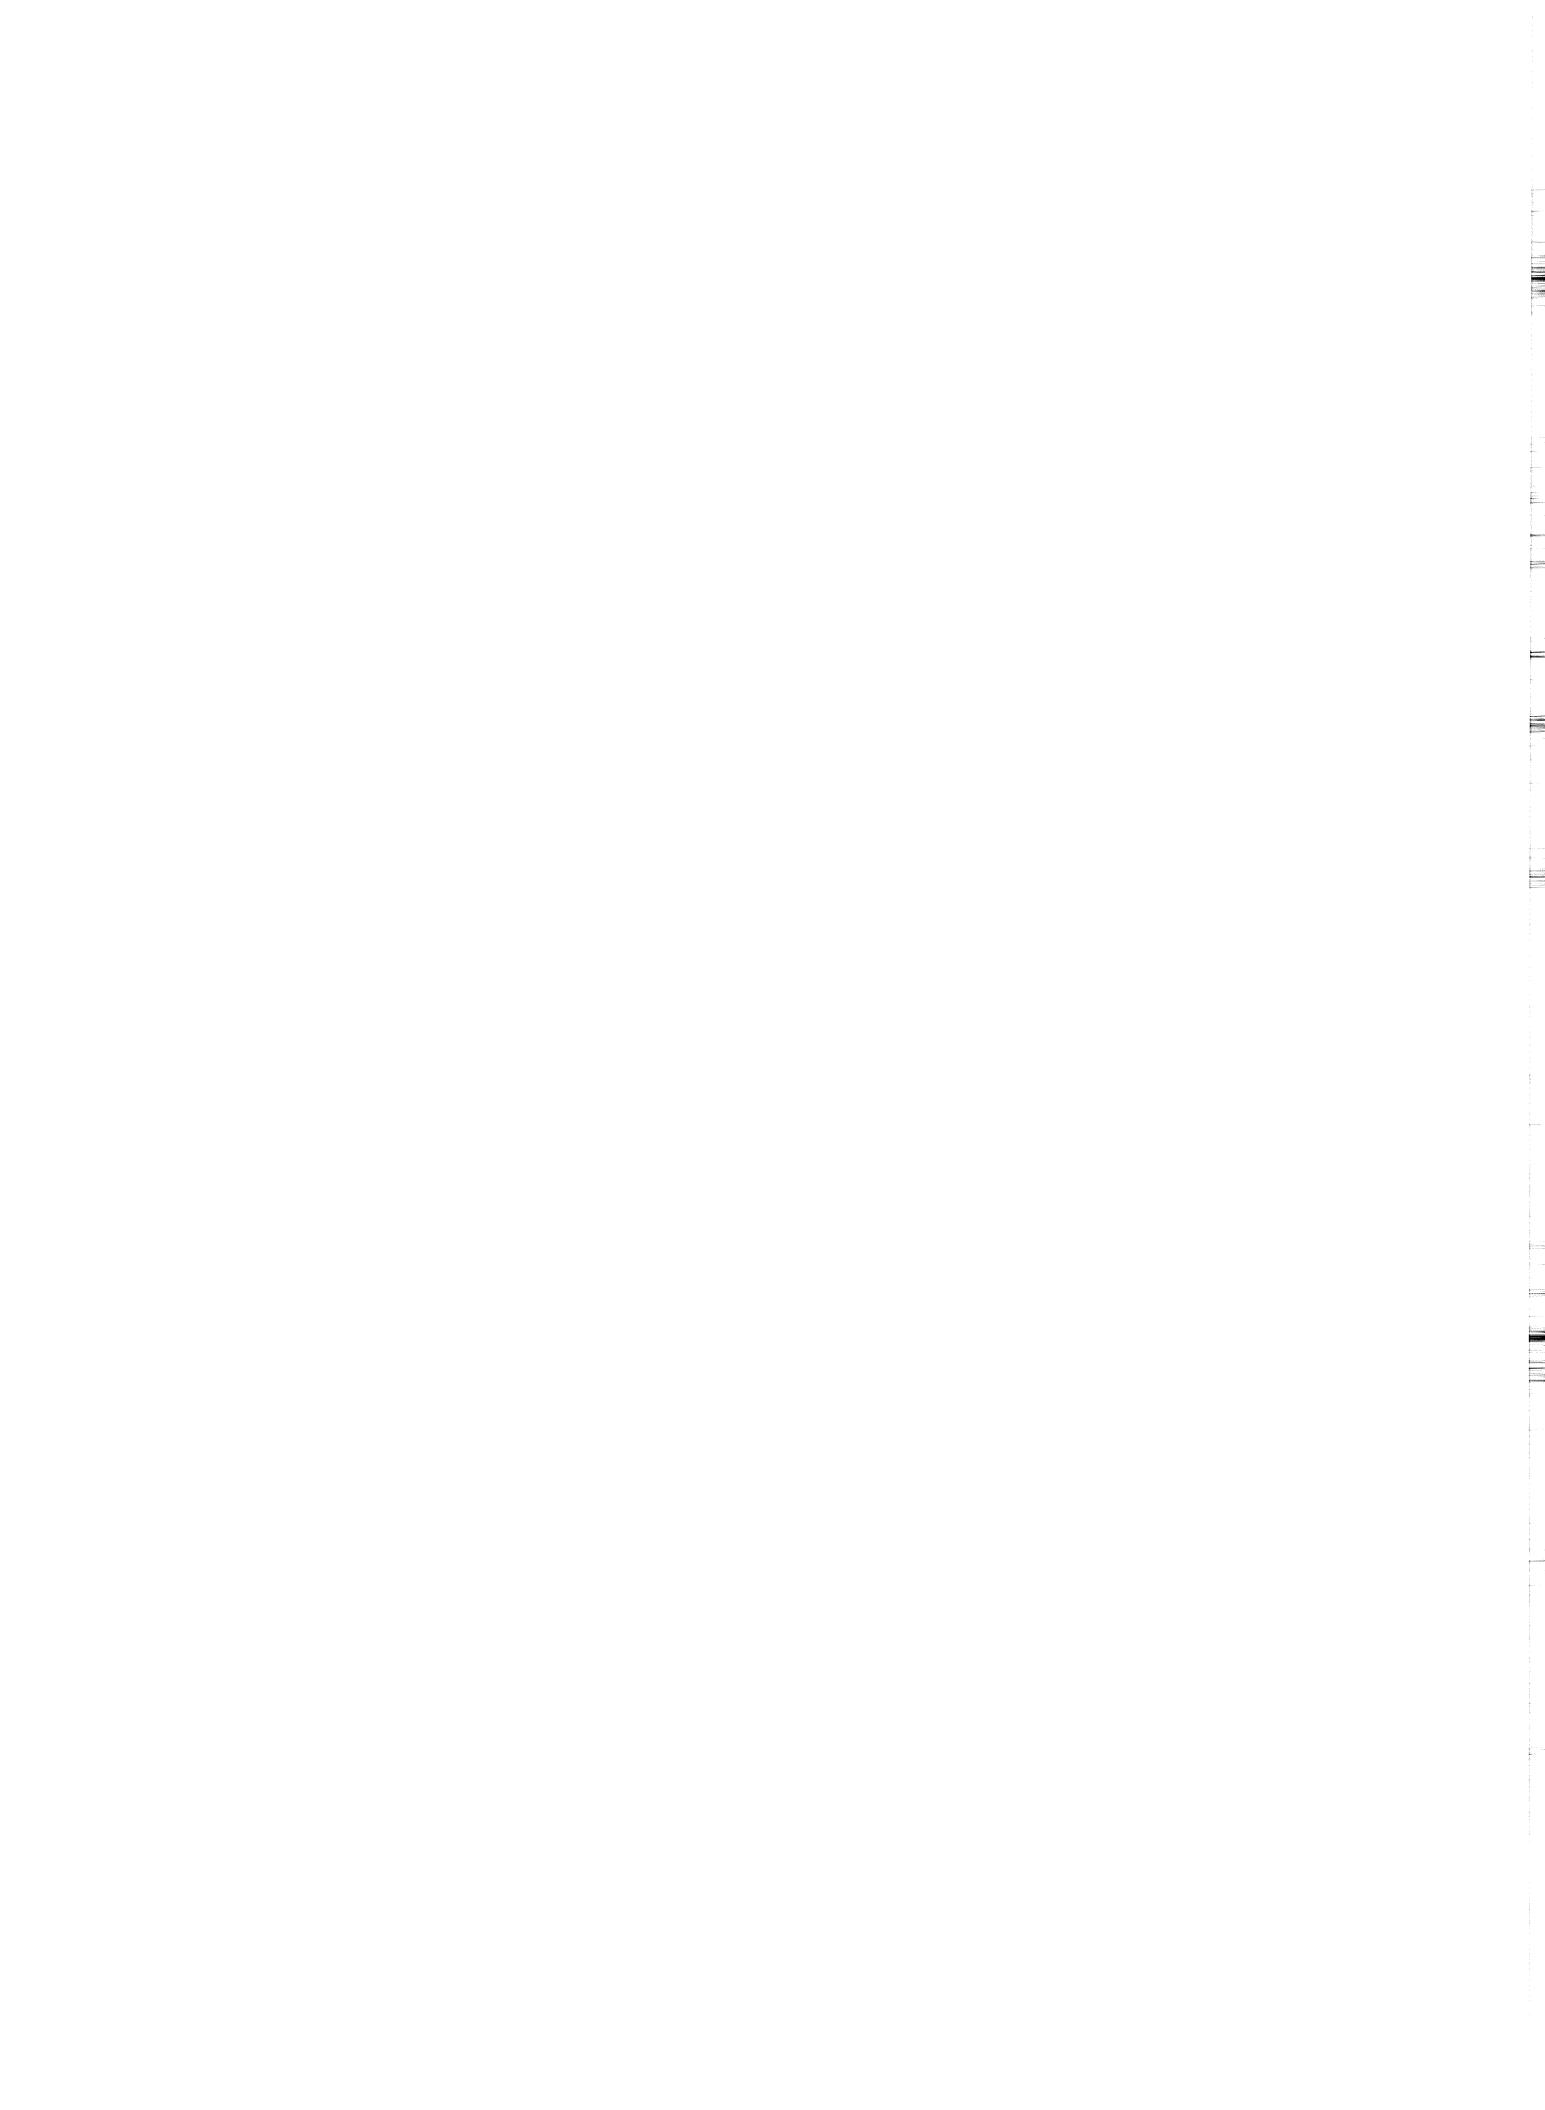

Table III.1. 1993 NOAA/7 Sediment T composition and intercomparison exercise results ($\mu\text{g/g}$ dry weight unless noted) (Ag not required.).

APPENDIX IV

1991 TRACE ORGANIC INTERCOMPARISON EXERCISE RESULTS

NIST: National Institute of Standards and Technology
BATTELLE: Battelle Ocean Sciences
NWFSC: NOAA/NMFS/Northwest Fisheries Science Center
TAMU: Texas A&M University/GERG

S1-A, S1-B, S1-C: Results from three gas chromatographic analyses of S1.
S1, S2, S3: Results from three independent sample preparations and analyses.
S1 Mean: The mean value of the reported S1 replicates, S1-A, S1-B, and S1-C.
S1-3 Mean: The mean concentration of the three samples, S1, S2, and S3, in which the mean value of the three GC replicates was used for the S1 concentration.
S1 %RSD: The percent relative standard deviation of the S1 replicates, S1-A, S1-B, and S1-C.
S1-3 %RSD: The percent relative standard deviation of the S1 Mean and the reported samples, S2 and S3.
Consensus value: NIST-calculated consensus value and standard deviation (s).
Mean Absolute %Error The mean of the absolute percent errors of the S1 Mean and the reported samples, S2 and S3 relative to the exercise consensus value.
z Score: The ratio of a bias estimate to a performance criterion. The difference between the laboratory mean and the accepted mean was used as the bias estimate. z Scores were calculated in two ways, using the SD of the S1-3 mean, and 25% of the accepted value as performance criteria.
N R : Not reported.
Z R : Zero or below MDL.

APPENDIX V

1992 TRACE ORGANIC INTERCOMPARISON EXERCISE RESULTS

NIST: National Institute of Standards and Technology
BATTELLE: Battelle Ocean Sciences
NWFSC: NOAA/NMFS/Northwest Fisheries Science Center
TAMU: Texas A&M University/GERG

S1-A, S1-B, S1-C: Results from three gas chromatographic analyses of S1.
S1, S2, S3: Results from three independent sample preparations and analyses.
S1 Mean: The mean value of the reported S1 replicates, S1-A, S1-B, and S1-C.
S1-3 Mean: The mean concentration of the three samples, S1, S2, and S3, in which the mean value of the three GC replicates was used for the S1 concentration.
S1 %RSD: The percent relative standard deviation of the S1 replicates, S1-A, S1-B, and S1-C.
S1-3 %RSD: The percent relative standard deviation of the S1 Mean and the reported samples, S2, and S3.
Consensus value: NIST-calculated consensus value and standard deviation (s).
Mean Absolute %Error The mean of the absolute percent errors of the S1 Mean and the reported samples, S2 and S3 relative to the exercise consensus value.
z Score: The ratio of a bias estimate to a performance criterion. The difference between the laboratory mean and the accepted mean was used as the bias estimate. z Scores were calculated in two ways, using the SD of the S1-3 mean, and 25% of the accepted value as performance criteria.
N R : Not reported.
Z R : Zero or below MDL.

APPENDIX VI

1993 TRACE ORGANIC INTERCOMPARISON EXERCISE RESULTS

NIST: National Institute of Standards and Technology
BATTELLE: Battelle Ocean Sciences
NWFSC: NOAA/NMFS/Northwest Fisheries Science Center
TAMU: Texas A&M University/GERG

S1-A, S1-B, S1-C: Results from three gas chromatographic analyses of S1.

S1, S2, S3: Results from three independent sample preparations and analyses.

S1 Mean: The mean value of the reported S1 replicates, S1-A, S1-B, and S1-C.

S1-3 Mean: The mean concentration of the three samples, S1, S2, and S3, in which the mean value of the three GC replicates was used for the S1 concentration.

S1 %RSD: The percent relative standard deviation of the S1 replicates, S1-A, S1-B, and S1-C.

S1-3 %RSD: The percent relative standard deviation of the S1 Mean and the reported samples, S2 and S3.

Consensus value: NIST-calculated consensus value and standard deviation (s).

Mean Absolute %Error The mean of the absolute percent errors of the S1 Mean and the reported samples, S2 and S3 relative to the exercise consensus value.

z Score: The ratio of a bias estimate to a performance criterion. The difference between the laboratory mean and the accepted mean was used as the bias estimate. z Scores were calculated in two ways, using the SD of the S1-3 mean, and 25% of the accepted value as performance criteria.

N R : Not reported.

Z R : Zero or below MDL.

Table VI.1. 1993 Mussel Tissue V (QA93TIS5) intercomparison exercise results (ng/g dry weight).
